The MINOS Experiment & Long Baseline ν Oscillation Programs in Europe and U.S.

Jon Urheim, U. of Minnesota

ICHEP 2002, Amsterdam, 27 July 2002

- Introduction
- MINOS Experiment Overview
- Status of MINOS – Construction & First Data
- Status of CNGS – [thanks to S. Katsanevas]
- Near-Future Initiatives in Europe and US

Introduction

- **picture emerging from existing data**
 - **Large effect at “atmospheric” Δm^2**
 - oscillation hypothesis very strong [Super K]
 - effect now seen at accelerator expt. [K2K]
 - dominant mode likely to be $\nu_\mu \rightarrow \nu_\tau$ [Super K]
 - **Also large effect at “solar” Δm^2** [Davis]
 - could be the LMA solution !! [Ga + SNO + SK]
 - **Questions:**
 - two angles large, what about the third θ_{13} ?
 - complex phase in MNS matrix \rightarrow CPV ?
 - what about CPT ? sterile neutrinos ? Extra dimensions ? where does LSND fit ?

Goals of 1st generation of Long Baseline Experiments

Confront emerging picture with precision data

- confirm deficit of ν_μ in accelerator-based exp't
- confirm oscillation hypothesis:
 must measure/know E & L precisely to see osc'ns in L/E
 pin down oscillation parameters
- demonstrate $\nu_\mu \rightarrow \nu_\tau$ is dominant mode:
 Tau appearance ! (CNGS \rightarrow direct, MINOS \rightarrow NC/CC)

Look for new phenomena

- evidence for non-zero θ_{13} : \rightarrow detection of ν_e
- test for possible CPT violation ?
- etc....

The MINOS Collaboration

Western Washington • Wisconsin

~30 Institutions ~250 physicists & engineers

NuMI / MINOS Concept

ν_{μ} source: (NuMI)

120 GeV protons from FNAL Main Injector

detectors: (MINOS)

1) 'Far' detector:

5.4 kT magnetized iron/scintillator
 tracker/calorimeter in Soudan mine

2) 'Near' detector:

980 T version of far detector at FNAL

3) Also:

'Calibration' detector
 in test beams at CERN

NuMI & The Main Injector

Fermilab Main Injector:

120 GeV protons
 4×10^{13} protons/pulse
1.9 sec rep rate
(~8 μ sec spill)
→ 0.4 MW

NuMI Beam:

Graphite target
Two magnetic horns
675 m. vac. decay pipe
hadron absorber

Beam Monitoring:

muon detectors
hadron detectors
+ Near Detector !

Soudan Underground Laboratory

- **former iron mine, now a state park,**
 - **home of: Soudan-1 & 2 , CDMS-II , and MINOS expts**

The MINOS Far Detector

Steel / Scintillator :

2.5 cm thick steel
 4 cm x 1 cm polystyrene
 – encased in Al cover
 15,000 Amp-turn coil

486 Layers → 5.4 kTon !

Readout:

WLS fibers glued into
 groove in scintillator
 – double-ended readout

Hamamatsu M16 pmt's
 – 8-fold optical summing

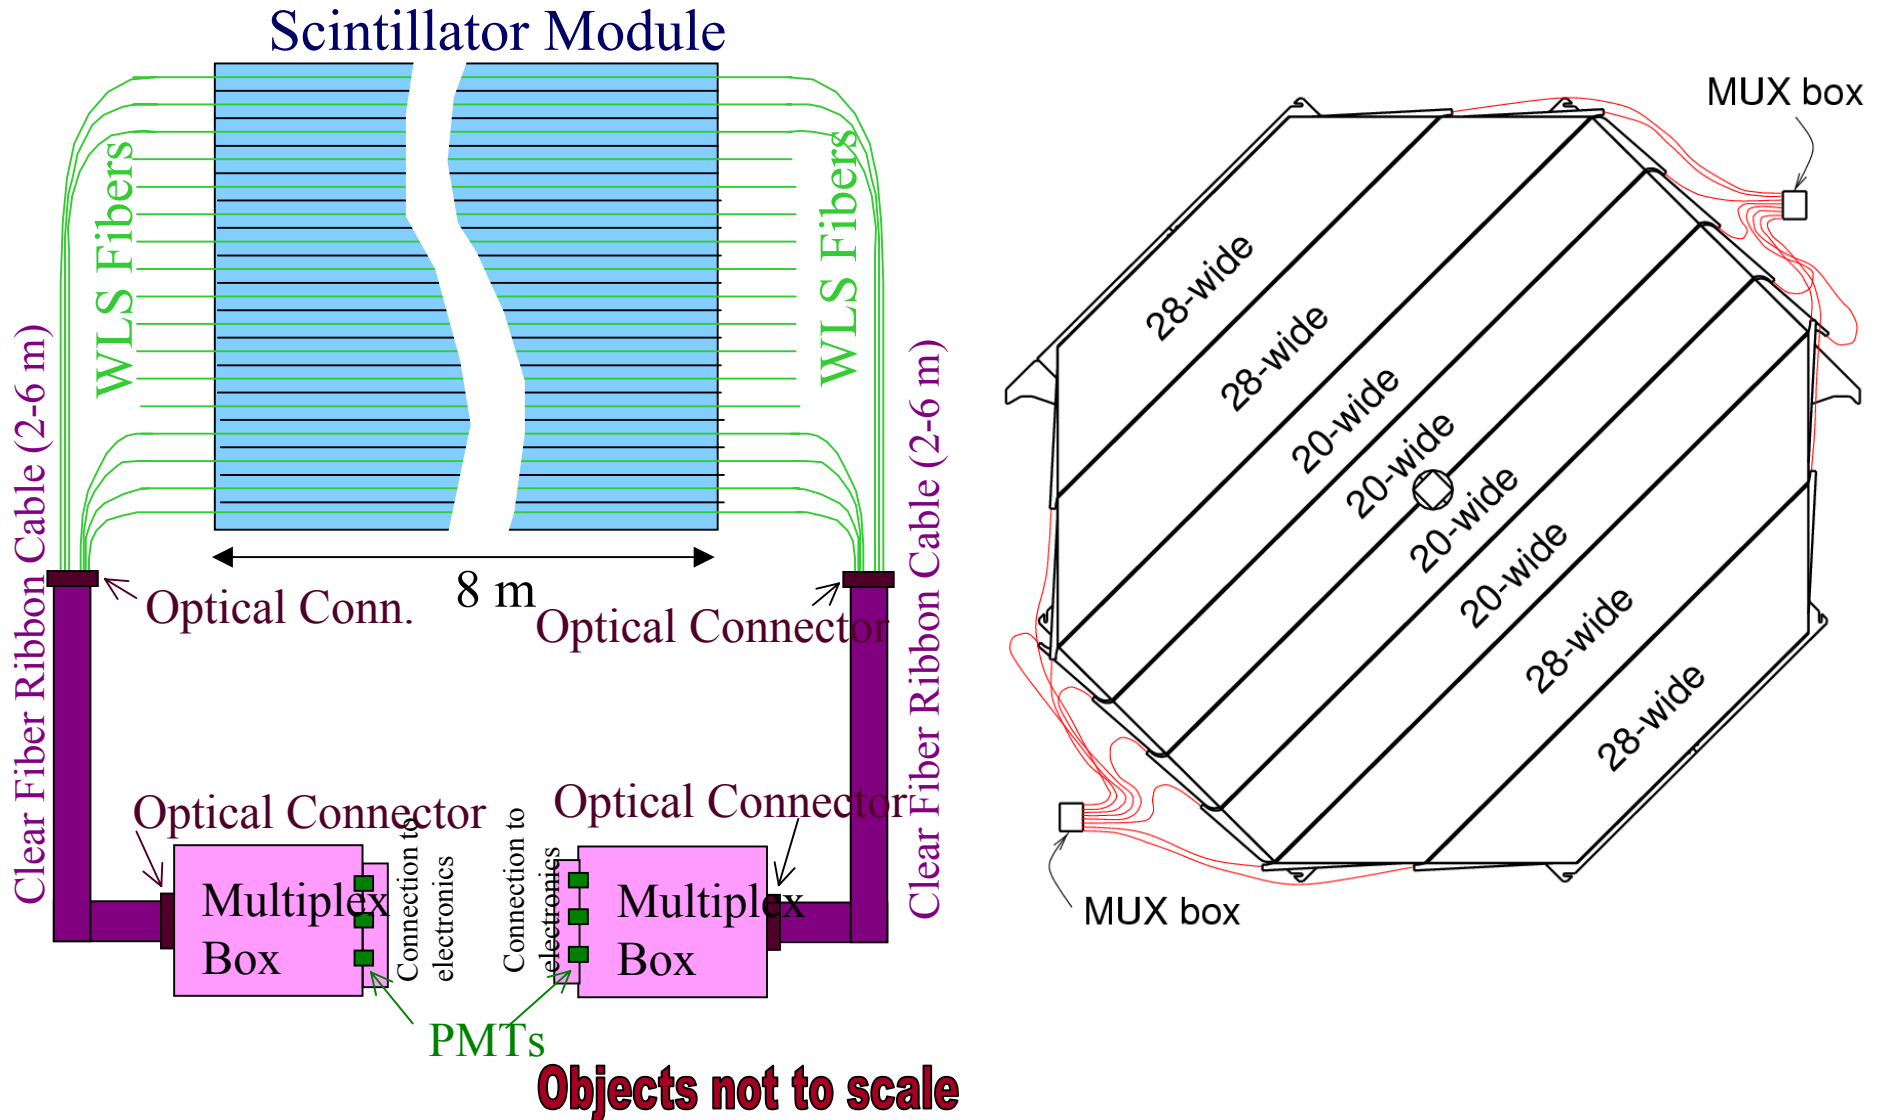

IDE 'VA' front-end chips
 pulseheight & time

GPS to synch to MI spill

Shown here: 1 (of 2) super modules
 – **248 planes: 8m x 8m x 15m !**

Far Detector Module Layout

Scintillator Detectors & PMTs

Spool of 1.2 mm WLS fiber being glued into groove

Hamamatsu M16 16-channel PMT (8 fibers per pixel)

4.1 cm x 1 cm polystyrene strips – coextruded with TiO₂ coating & groove for WLS fiber

The MINOS Near Detector

1 Ton version of far det.

290 m d/s of hadron absorber
 → beam is small !

→ 4 regions:
 'veto' + 'target' + 'shower'
 + 'spectrometer' (sparse)

make as similar to
 far detector as possible !

Readout:

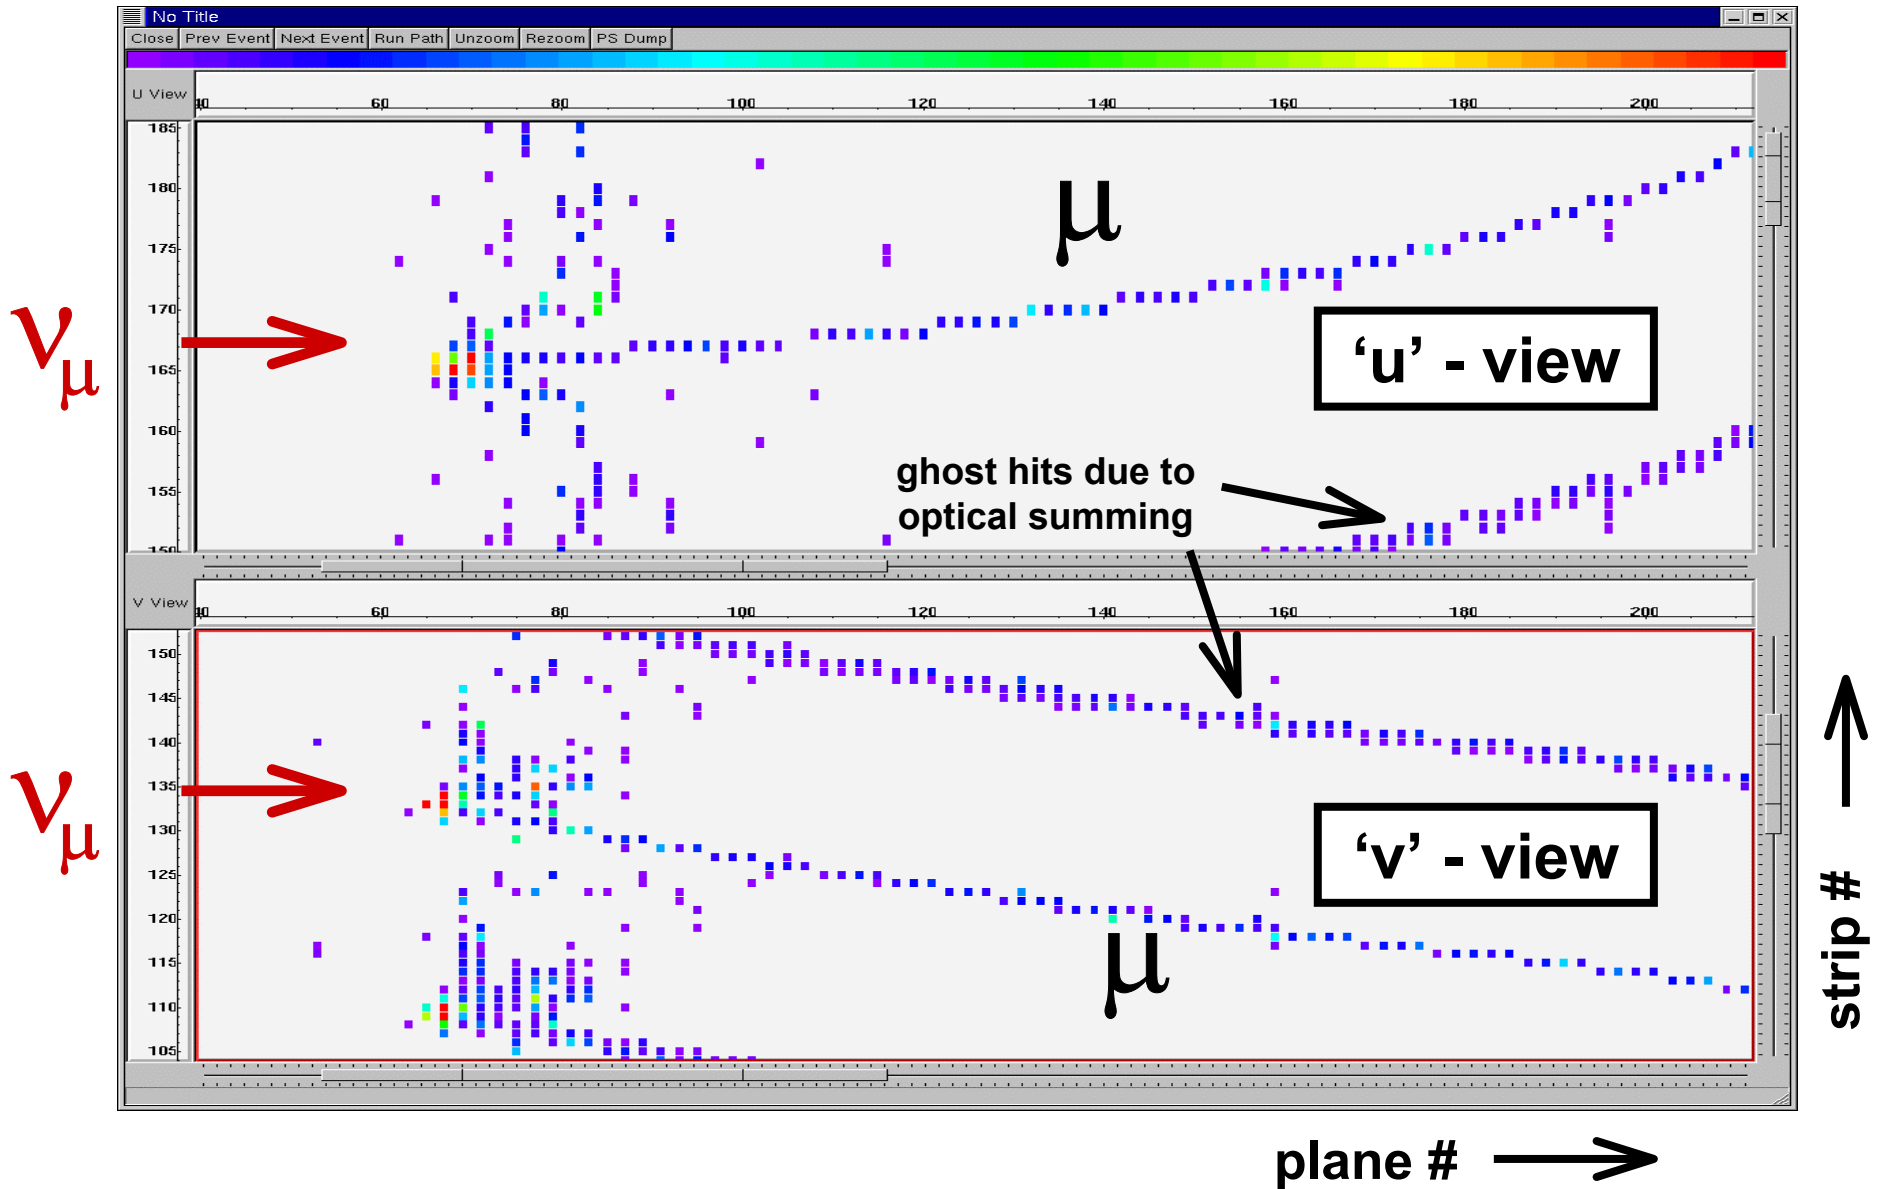

Hamamatsu M64 pmt's

High instantaneous rates
 (~50 ν events / 8 μ sec spill)
 → fast front ends needed

→ use FNAL QIE chips
 (based on KTeV version)

Simulated Neutrino Interaction

Beam Energy Considerations

Pre – Super K:

$$\Delta m^2 \sim 0.01 \text{ eV}^2 \text{ (IMB, Kam..)}$$

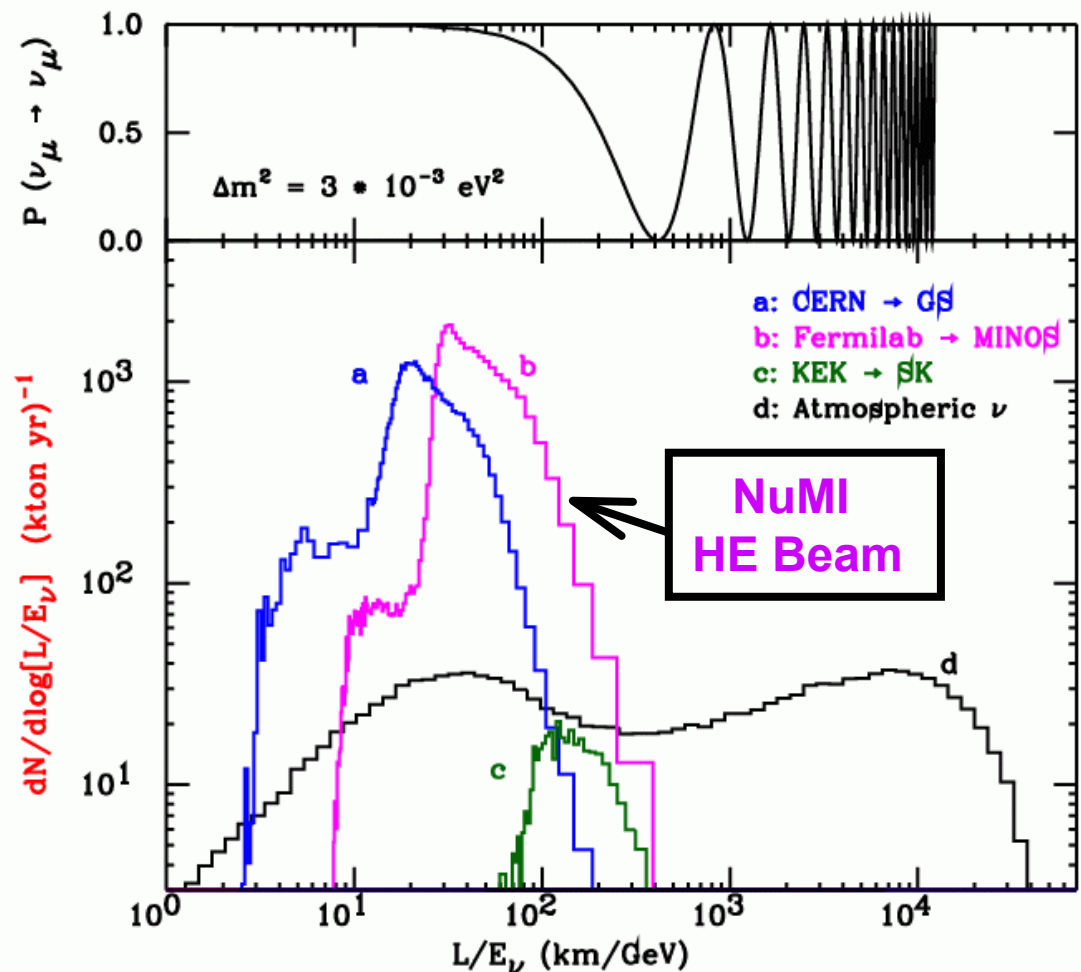

- NuMI ‘high energy beam’ gives best sensitivity
- good prospects for observation of ν_τ

Post – Super K:

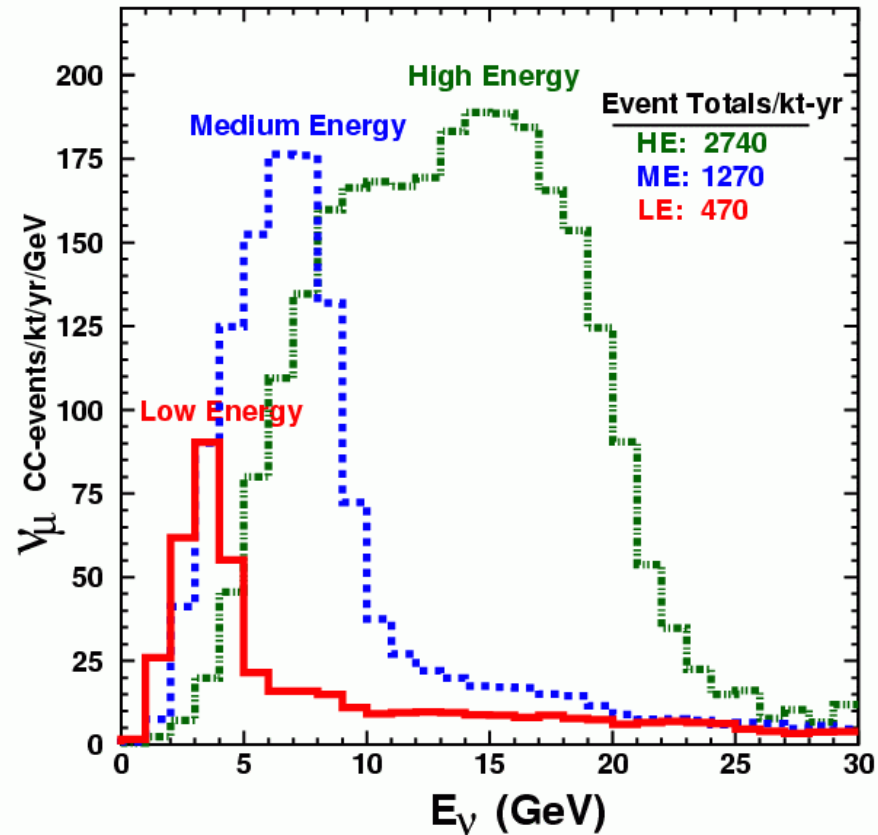

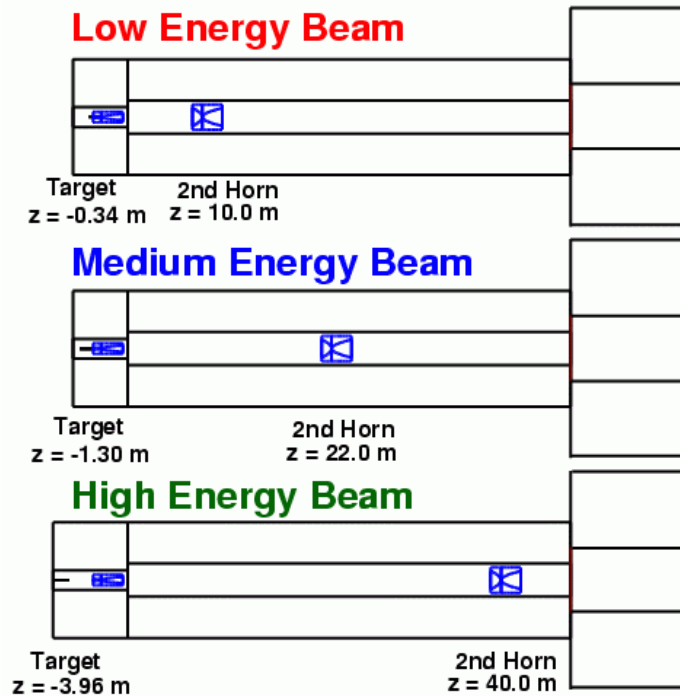

$$\Delta m^2 \sim 0.001 - 0.004 \text{ eV}^2$$

- Can’t increase “L”
- High energy beam no longer desirable !
- But NuMI beam was designed to be tunable !

From: Battistoni & Lipari,
hep-ph / 9807475

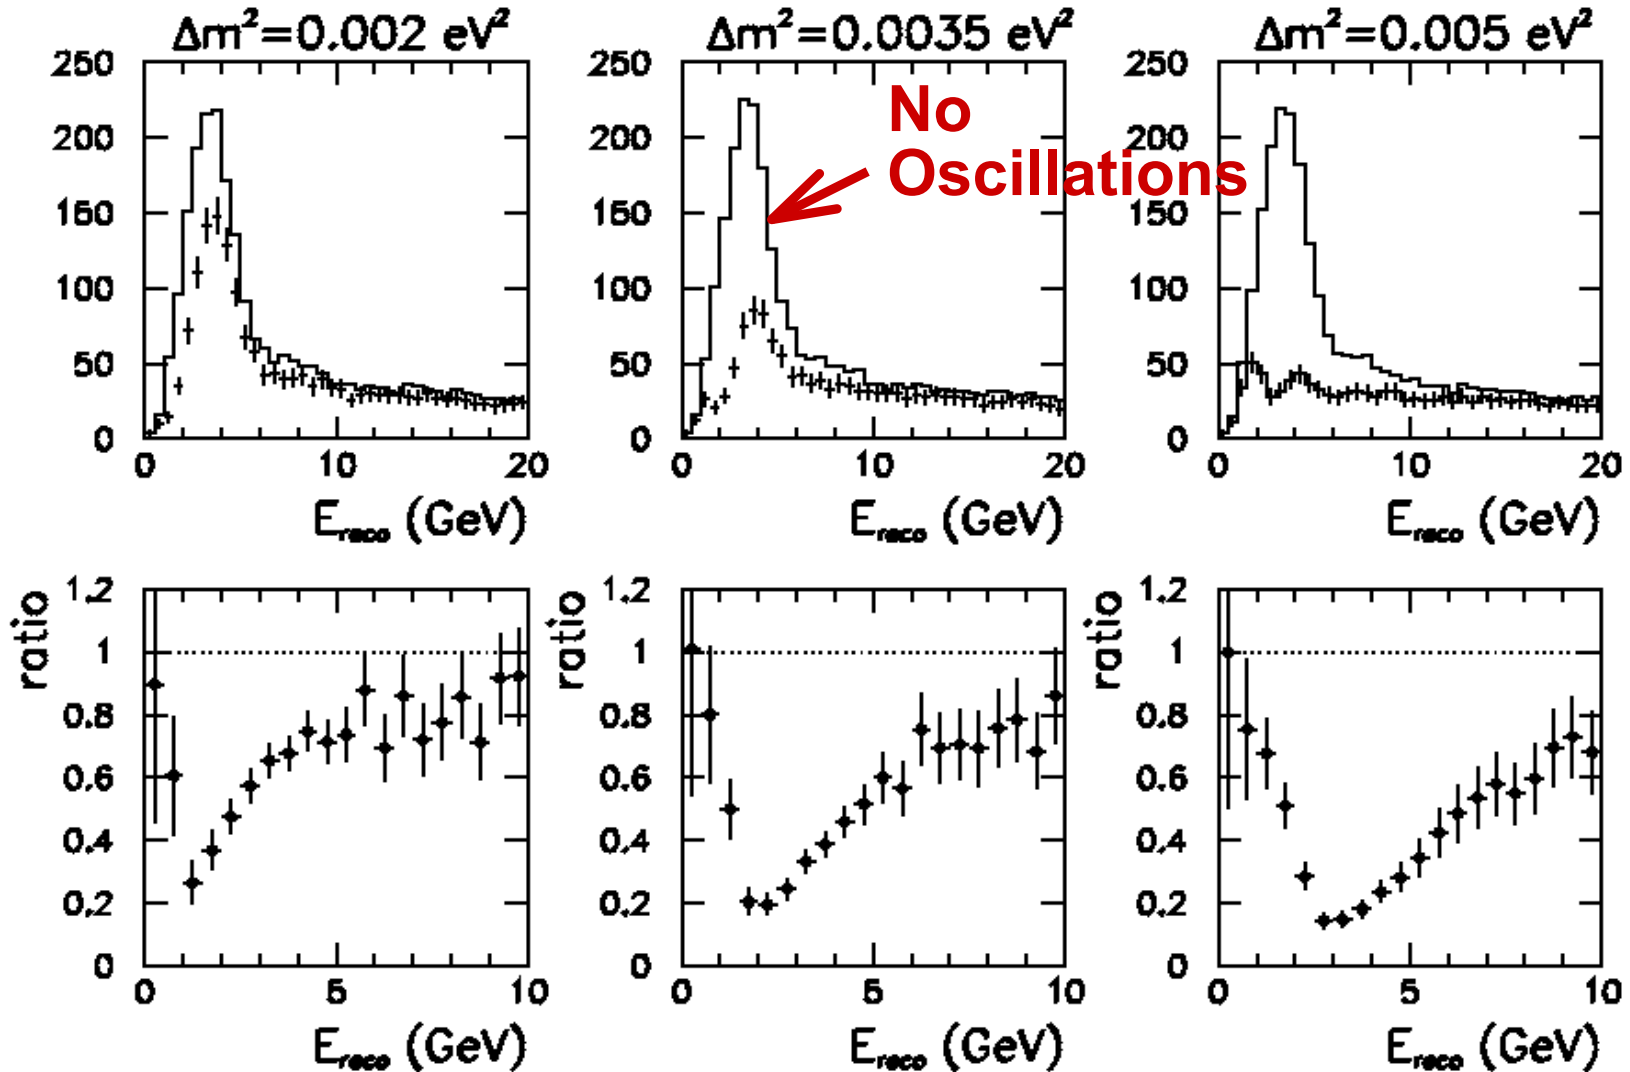

Configurable 2-Horn Design

- Low energy beam: less flux, but better match to Δm^2
- Still plenty of events: **~ 5000 ν_μ CC events in 2 yrs**

Expected Neutrino Energy Dist'ns

- What we might see in 2 yrs of running

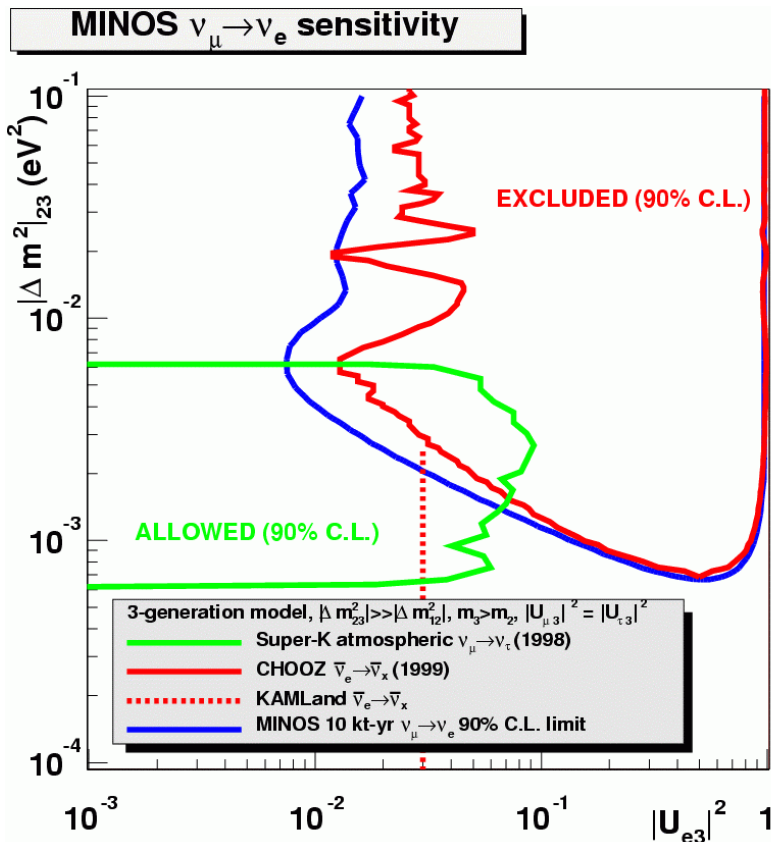

MINOS sensitivity to Oscillations

Two-neutrino mixing:

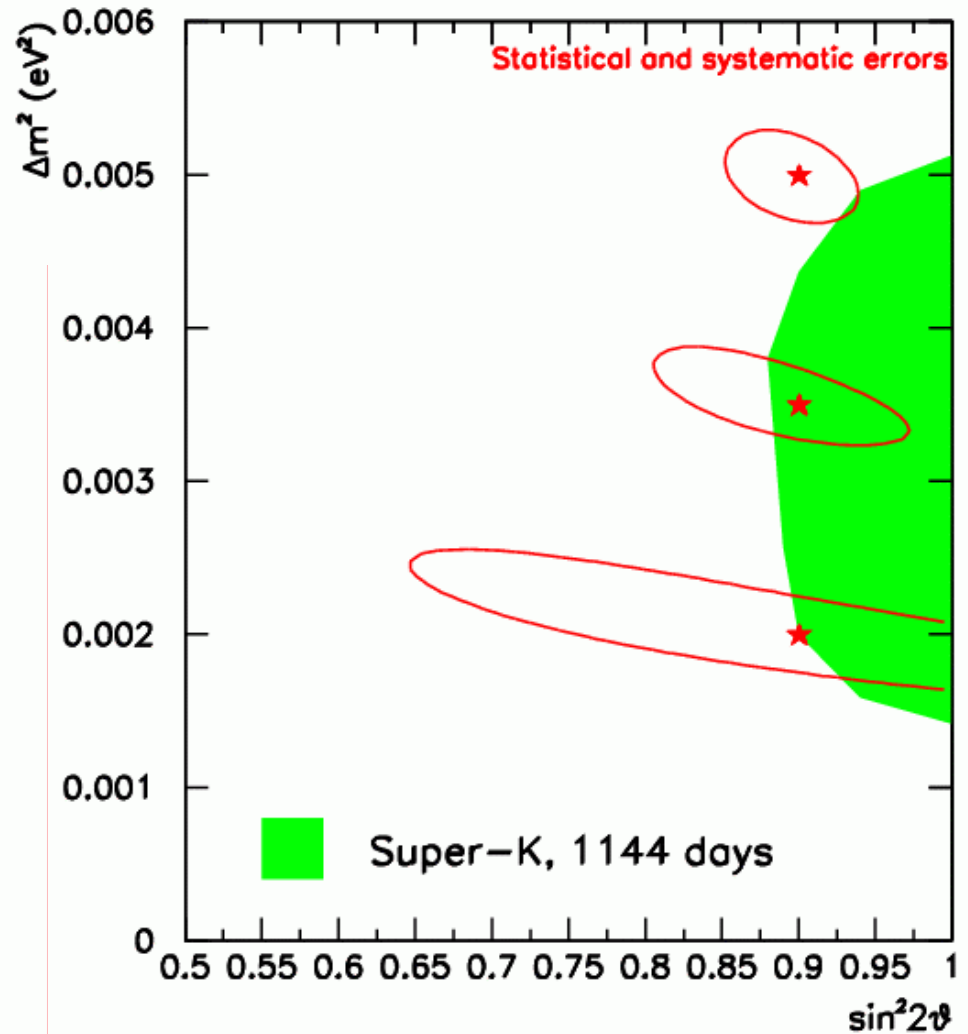

see figure at right → 2 yrs

note: we expect to run longer !

Search for ν_e appearance:

Ph2Ie, 10 kt. yr., 90% C.L.

Status of Far Detector Construction

27 July 2002

Status of Detector & Beam Construction (cont'd)

- **Far Detector Supermodule 1 completed, 24 June**
 - 248 planes, (~7 planes per week since Aug, '01)
 - Coil now installed, to be energized this week !
 - Supermodule 2 already being assembled → finish in April '03
- **Near Det. Plane Assembly ongoing at FNAL**
 - Being done on surface while expt'l hall is outfitted
 - Excellent progress so far
- **Excavation of Beam Line & Near Det. Hall is done**
 - Installation of 2-m diameter, 675-m long decay pipe under way
 - Prototype horn 1 tested, production horns being fabricated
 - Design of target pile nearly complete
- **NuMI Beam commissioning in late 2004 !!**

NuMI Construction

Horn 2 inner conductor →

NuMI 675-meter decay pipe segment being installed...

Horn 1 prototype, being tested...

First Look at Far Detector Data

Detector commissioned as construction proceeds:

cosmic ray / atm neutrino data taken mainly nights & weekends

→ exposure measured in kton-months so far !

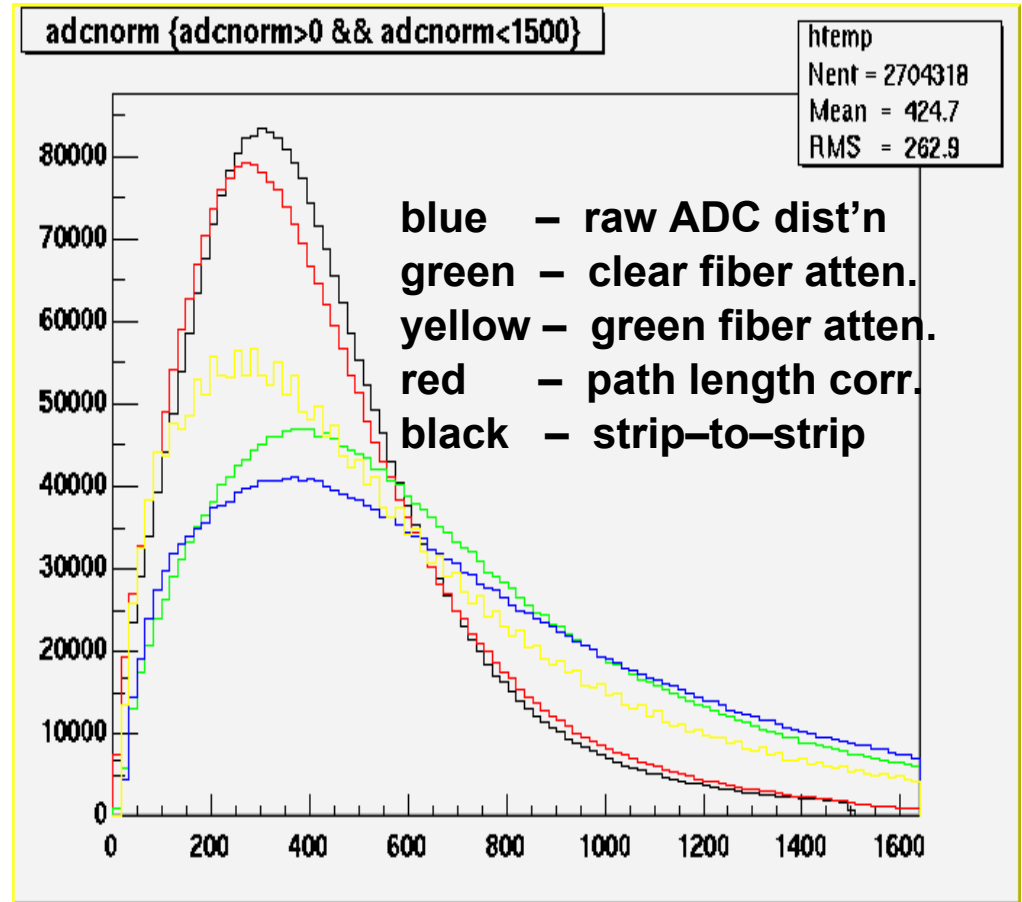

→ but will run SM 1 ~full-time during construction of SM 2

First attempts to calibrate !

note: 192 strips/plane X
248 planes X 2 ends/strip =
~ 95,000 strip-ends in SM 1

pulse height (min-l) & timing

Calibration Detector at CERN:
relates hadron/em shower energy to min-l depos'n.

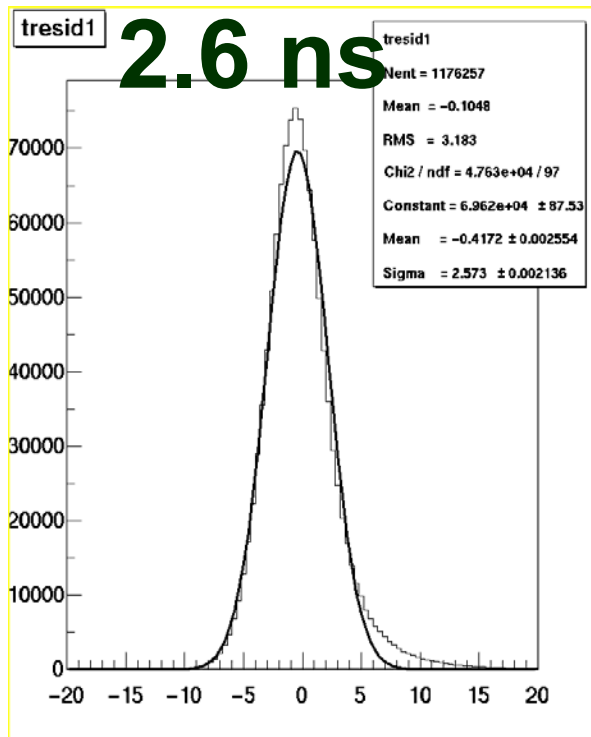

ADC value

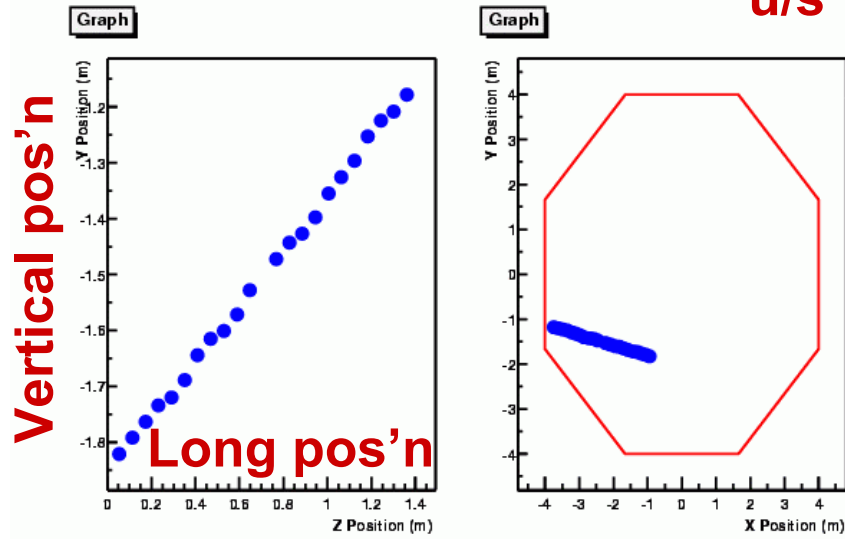

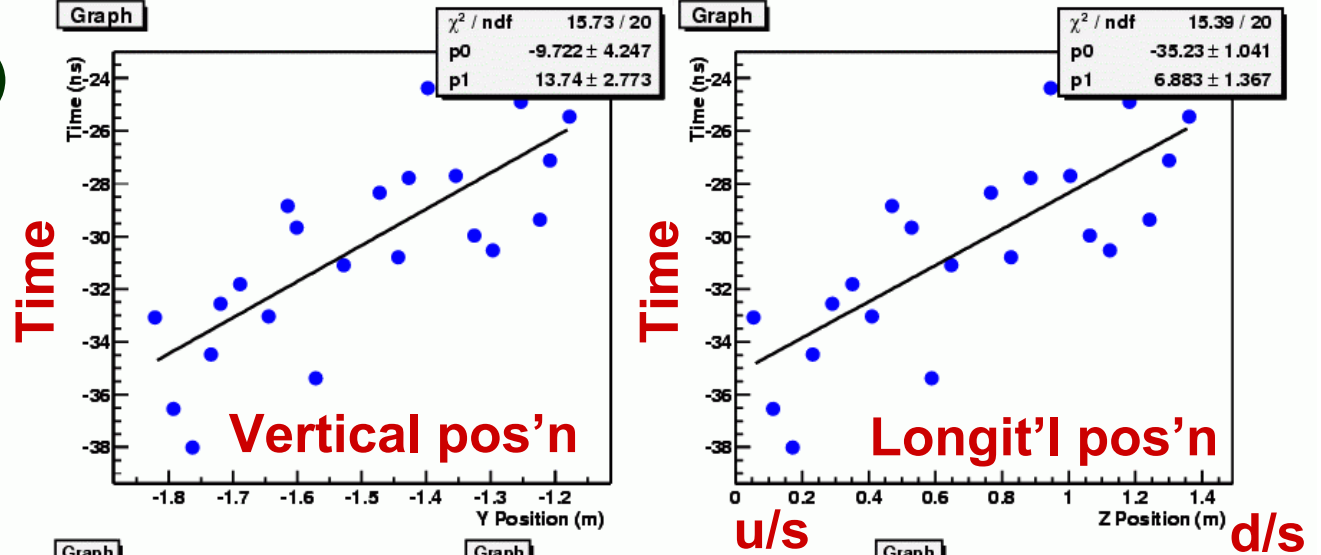

Pulseheight Calibration

First upward-going muon !

Muon entered at front face (plane 0),
exited at side (plane 24)
Good timing is key !
Single strip timing resol'n:

Run 3281, Snarl 2621.
 $\beta^{-1} = -0.850628, \phi = 154.875501, \chi^2 = 0.342965, \text{Planes Hit} = 24$

(Downward-going) Candidate: Partially Contained ν_μ Event ?

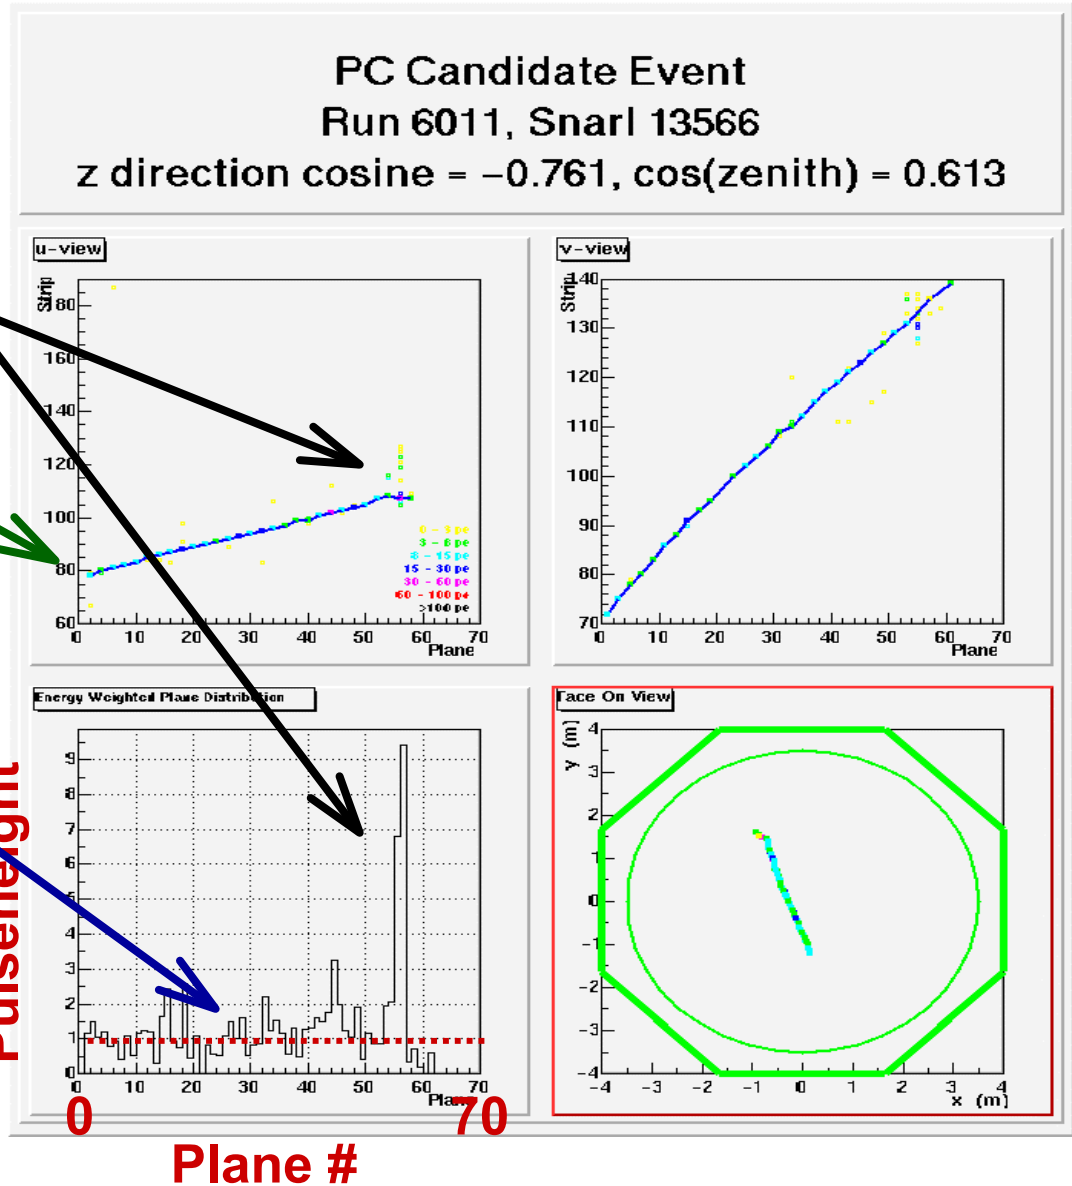

Neutrino interaction
around plane 60
(large energy deposit)

muon exited through
front face of detector
(plane 0)

Note energy deposited
by muon consistent w/
minimum ionizing

Cosmic ray muon
backgrounds are
non-trivial !

→ veto shield needed?

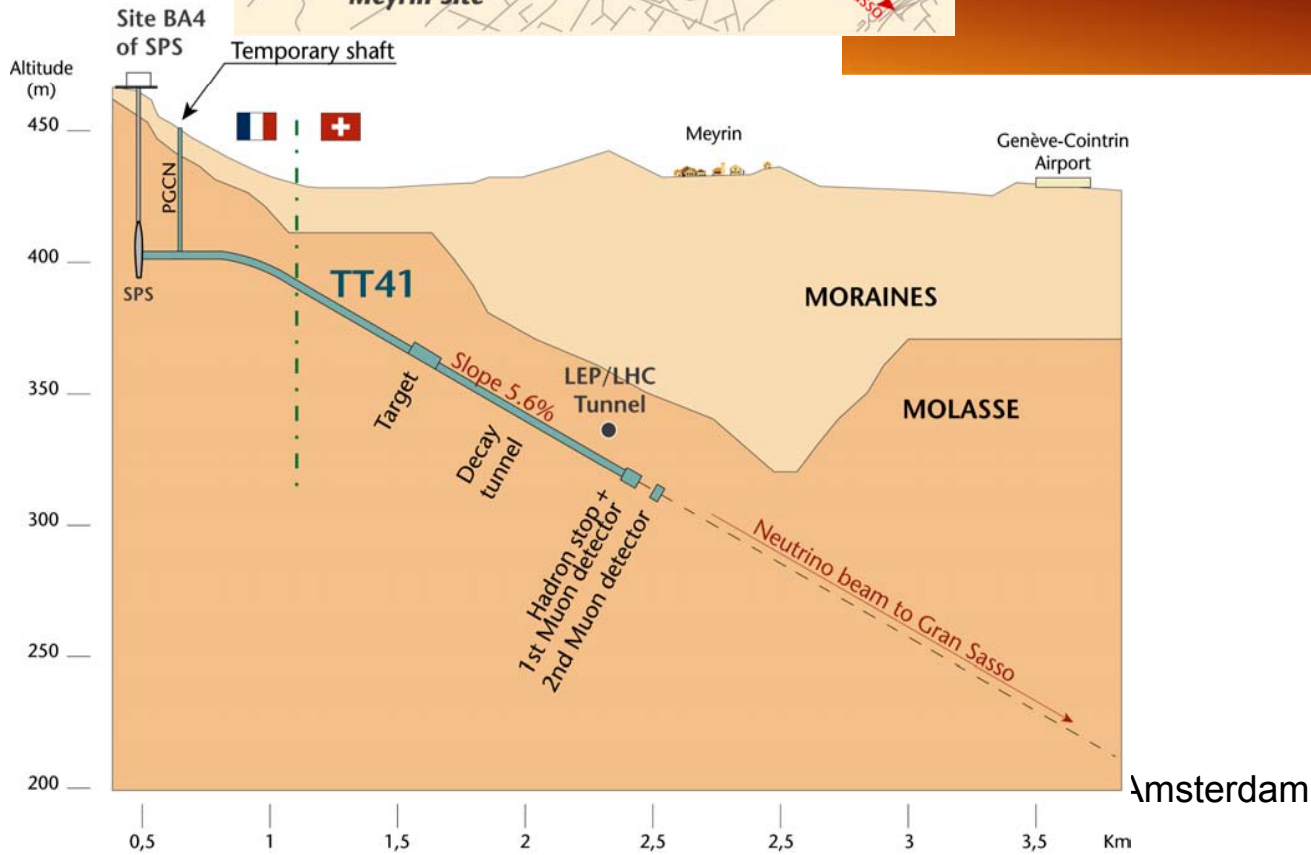

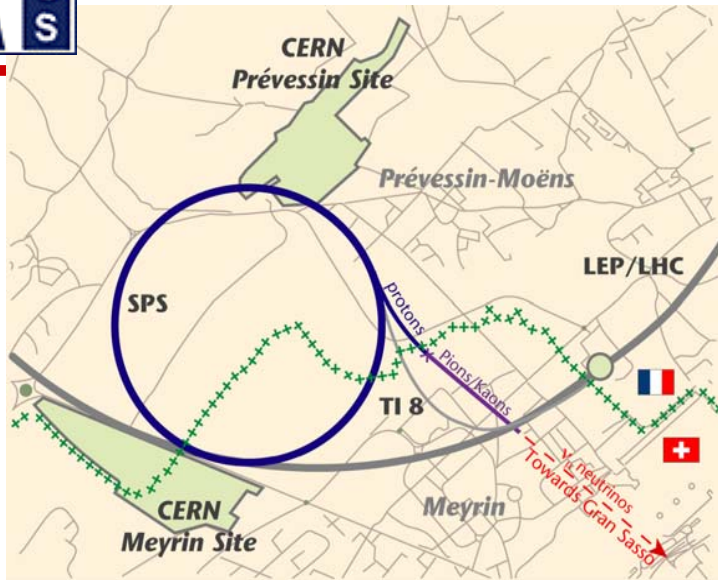

Summary of MINOS

- **Data-taking w/ NuMI beam will begin in late 2004**
 - **Far & Near detector on schedule, Far det. already 1/2 complete** (detector very stable: < 1 ns timing drifts, ~ 1% pulseheight drifts)
 - **Calibration detector running & data analysis will be complete**
 - **much progress on NuMI: civil & technical components**
- **By 2007, will have precise measurements:**
 - **osc'n parameters: $\nu_\mu \rightarrow \nu_\tau$ case;** (NC/CC ratio for mode id)
 - **search for subdominant $\nu_\mu \rightarrow \nu_e$**
- **Will also have ~ 24 kiloton-year exposure to atm. ν 's**
 - **energy, direction resol'n \rightarrow Minos competitive on $\nu_\mu \rightarrow \nu_\tau$**
 - **1st direct search for CPT non-cons. ($\bar{\nu}_\mu \rightarrow \bar{\nu}_\mu$ vs $\nu_\mu \rightarrow \nu_\mu$)**
- **'conventional' neutrino physics w/ near detector**

The CNGS project

INFN - LNGS
Laboratori Nazionali del Gran Sasso

Annual Report 1999

The CNGS Project

- Targeting direct observation of $\nu_{\mu} \rightarrow \nu_{\tau}$
- High energy beam from 400 GeV CERN SPS
 - needed to produce tau's
- Fine-grained detectors: OPERA & ICARUS
 - needed to identify tau decays !
- Excellent capabilities for electron detection
 - can do well on $\nu_{\mu} \rightarrow \nu_e$ search
 - high energy beam a handicap here, unless Δm^2 is large
- **CNGS civil construction far along !!**
 - current projection to deliver neutrinos in 2006 (?)
 - [exact date may depend on CERN schedule for SPS running]

The CNGS Neutrino Beam

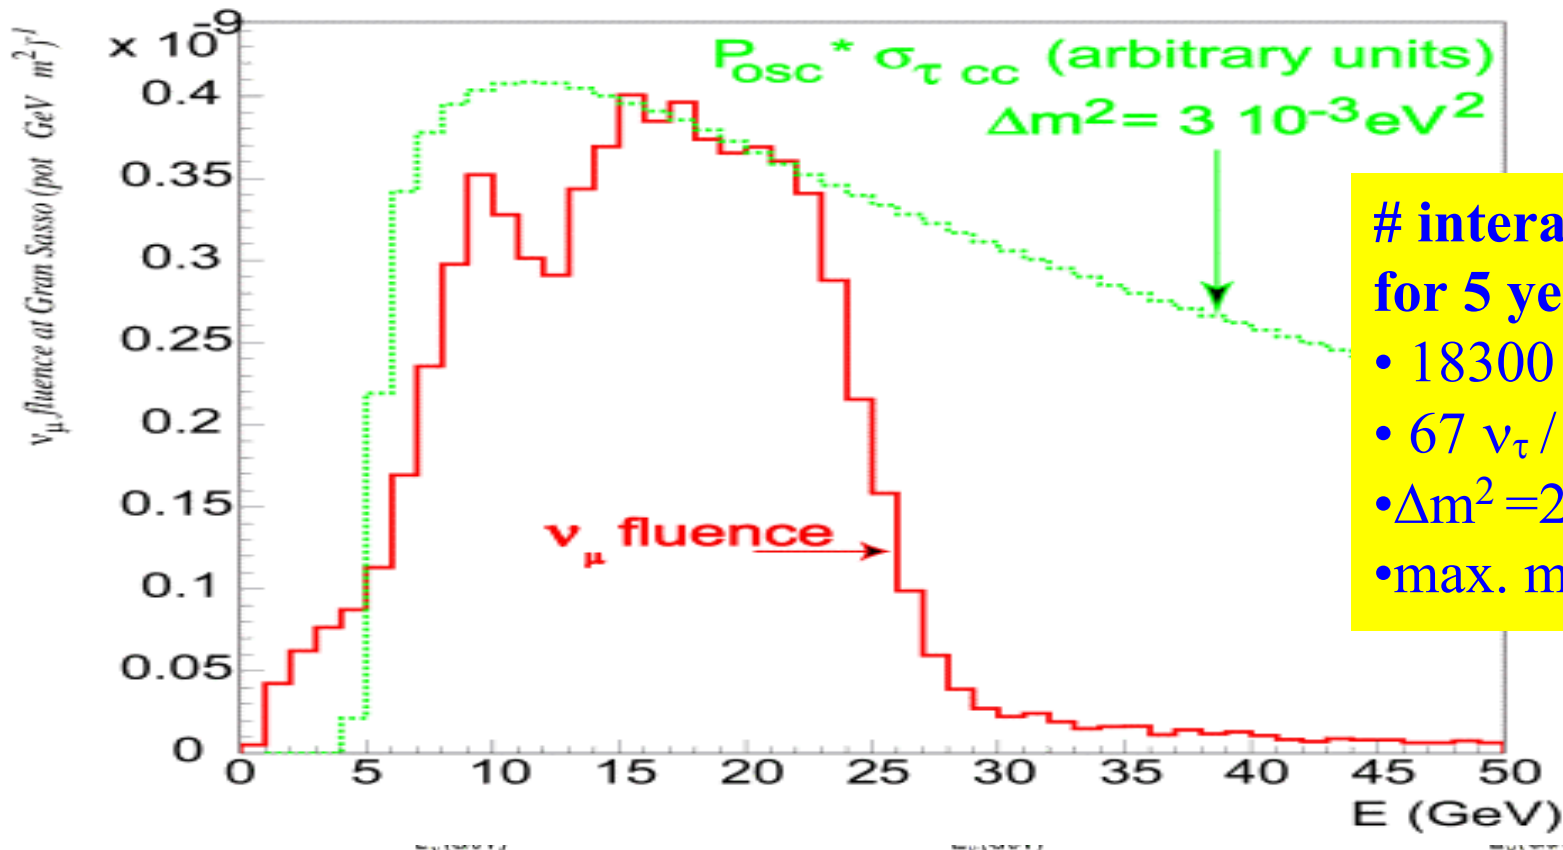

Shared SPS operation

200 days/year

4.5×10^{19} pot / year

$\langle E \rangle_\nu$ (GeV)	17
$(\nu_{e^+} + \bar{\nu}_e) / \nu_\mu$	0.87 %
$\bar{\nu}_\mu / \nu_\mu$	2.1 %
ν_τ prompt	negligible

**Slide courtesy
S. Katsanevas**

**# interactions ν
for 5 years :**

- 18300 NC+CC / kt
- 67 ν_τ / kt
- $\Delta m^2 = 2.4 \times 10^{-3} \text{ eV}^2$
- max. mixing

S. Katsanevas

Electronic detectors to select bricks with ν interactions (plastic scintillator strips)

- Target Tracker tasks :
 - select bricks efficiently
 - initiate muon tagging

Sampling by Target Tracker planes (X,Y)

$X_{\text{true}} - X_{\text{rec}} \text{ (cm)}$

$\sigma = 1.5 \text{ cm CC}$
 3.0 cm NC

Slide courtesy
S. Katsanevas
Event as seen by the
Target Tracker

OPERA Experiment Sensitivity

- Sensitivity to many decay modes of tau lepton
- Expect to take data for 5 yrs → 9 kTon-yrs.
- Low Backgrounds (0.75 events)

- Expected event yields:
 - $\Delta m^2 = 1.2 \times 10^{-3} \text{ eV}^2$: 2.7 events
 - $\Delta m^2 = 2.4 \times 10^{-3} \text{ eV}^2$: 11 events
 - $\Delta m^2 = 5.4 \times 10^{-3} \text{ eV}^2$: 54 events

Readout electronics

Expected sensitivity to θ_{13}

ICARUS
5 years dedicated SPS
 2.35 kton fid. mass

Sensitivity assuming both $\nu_\mu \rightarrow \nu_\tau$ and $\nu_\mu \rightarrow \nu_e$ at the same Δm^2 (three family mixing)

$\sin^2 2\theta_{13} > 2 \times 10^{-2}$
 for $\Delta m_{32}^2 = 3 \times 10^{-3} eV^2$

Θ_{13} limit from 9 to 50

Long Baseline Experiments: The Next Generation

- Geared toward observation of $\nu_\mu \rightarrow \nu_e$ at Δm^2_{atm}
- Off-Axis (2°) CNGS beam to off-shore detector
 - Under-water $\bar{\nu}_\mu$ detector 1200 km from CERN in G. of Taranto
 - Low energy beam config. @ 0.8 GeV (2^{nd} osc. max.)
 - EOI: <http://home.cern.ch/dydak/oscexp.ps>
- Off-Axis ($0.5\text{-}1^\circ$) NuMI beam to surface detector
 - sites in Minnesota ($\sim 700+$ km) & Canada (~ 900 km) possible
 - 20 kTon detector, possibly H₂O, possibly RPC, possibly scint.
 - Sensitivity to θ_{13} at 1.5×10^{-3} level
 - LOI (Fermilab P929):
http://www-numi.fnal.gov/fnal_minos/new_initiatives/
 - Note: 1-Day meeting at UC London, Monday September 16

Long Baseline Experiments: More Ideas for future

- BNL beams to NUSL, Upstate NY, Soudan...
 - Upgrades to AGS: 0.5 – 1.3 MW
 - Letter of Intent: [hep-ex/0205040](#)
- CERN beam to Frejus
 - New low-energy proton synchrotron (2 GeV) re-using LEP RF
 - 300 MeV neutrino energy, H₂O detector
- “Beta-Beam” to Frejus
 - ν_e and $\bar{\nu}_e$ from accelerated ^{18}Ne and ^6He ions
 - 300 MeV neutrino energy, H₂O detector
- Krasnoyarsk reactor experiment – ν_e disappearance
 - Improve on Chooz sensitivity by factor of ~8
- Haven't mentioned FNAL proton driver, or ν factories

Summary

– Exciting time for Long Baseline experiments

- MINOS construction far along— first look at cosmics
- Significant progress in CNGS program
- Interesting ideas for next generation:
 - **NuMI off-axis, CNGS off-axis, BNL beams, beta beams...**

– Far future will depend on what current and next generation exp'ts turn up!

- If θ_{13} is not so small, possibility of seeing CP violation will be too good to pass up.
- This will require a significant international project
