

7th International Workshop on Neutrino Factories and Superbeams

NuFact 05

June 21-26, 2005

Laboratori Nazionali dell' INFN
Frascati (Rome), Italy

SPL → Fréjus

Scientific Program Committee

- A. Blondel (Geneva U.)
- J. Bouchez (Saclay)
- D. Casper (Irvine)
- Y. Declais (Lyon U.)
- A. de Rujula (CERN)
- R. Edgecock (RAL)
- ... (CERN)
- ... (Barcelona)
- ... (b)
- ... (U.)
- ... (N)
- ... (encia)
- ... (Muenchen)
- ... (CERN)
- K. Long (Imperial College)
- Y. Kuno (Osaka)
- F. Meot (Saclay)
- M. Mezzetto (INFN)
- Y. Mori (KEK)
- K. Nakamura (KEK)
- V. Palladino (INFN)
- F. Ronga (INFN)
- A. Rubbia (ETH Zurich)
- T. A. Shibata (Tokyo Tech)
- P. Strolin (INFN)
- G. Tzanakos (Athens)
- O. Yasuda (Tokyo Met U.)
- M. Zisman (LBNL)

International Advisory Committee

- R. Aleksan (Marseille)
- R. Aymar (CERN)
- S. Bertolucci (INFN)
- M. Calvet
- S. Chatto
- H. Chen (
- E. Coccia
- P. Dornan
- B. D'Ettor
- U. Dossell
- R. Eichler
- J. Engeler
- G. Fortun
- B. Foster
- S. Holmes
- B. Kayser
- S. Katsan
- T. Kirk (B
- R. Klanner (DESY)
- Y. Kuno (Osaka)
- S. Myers (CERN)
- M. Lindroos (CERN)

J-E Campagne
 Linear Accelerator Laboratory - Orsay - France

Thanks: A. Cazes, M. Mezzetto, Th. Schwetz
 and the GLoBES team
 and AM Lombardi, R. Garoby

SPL block diagram (CDR 1)

Characteristics (Conceptual Design Report 1):

- are “optimized” for a neutrino factory
- assume the use of LEP cavities & klystrons up to the highest energy

Gradients at 700 MHz

from Stephane Chel, HIPPI04, Frankfurt, sep04

Last test performed in CryHoLab (July 04):

5-cells 700 MHz $\beta=0.65$ Nb cavity A5-01

from CEA/Saclay and IPN-Orsay

LEP cavities may have worked 350MHz & 3.6MV/m effective gradient
NuFact Note 040

New optimization questioned @ MMW04*

Particle production

Horn design optimisation

Decay tunnel parameter optimisation

Flux computation at Fréjus

θ_{13} and δ_{CP} sensitivity.

LAL – 04-102 submitted to EPJC

*: Multi MegaWatt Workshop at CERN 26-28 May 04

Particle production

Proton beam :

1. Pencil like
2. $E_k=2.2\text{GeV}, 3.5\text{GeV}...$

Target :

1. 30cm long cylinder, $\varnothing 15\text{mm}$ in Liq. Hg
2. FLUKA 2002.4

Normalized to a power of 4MW:

$1.14 \cdot 10^{23}$ pot/yr @ 2.2GeV

$0.71 \cdot 10^{23}$ pot/yr @ 3.5GeV

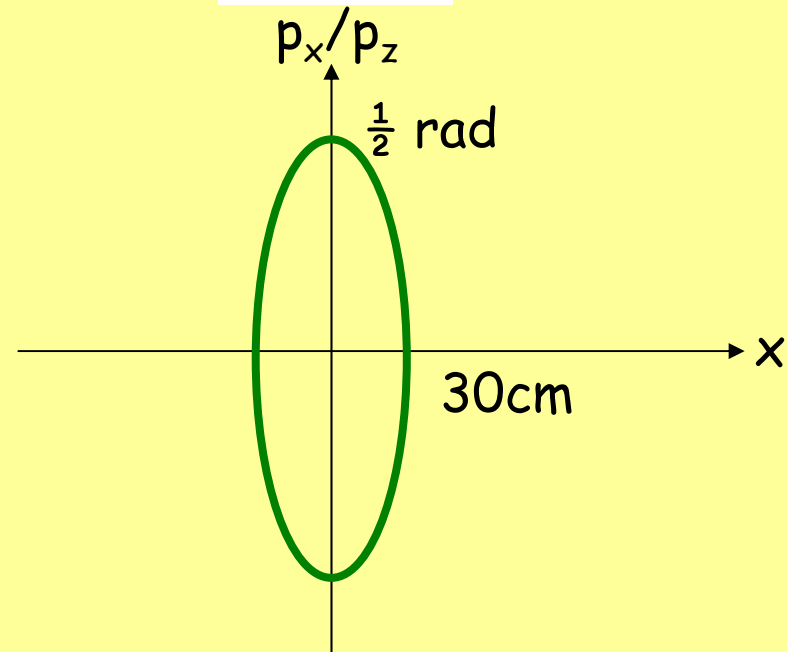

SuperBeam vs ν Fact Optics

Super Beam

Spot size @ 130km
Decay tunnel size

ν Fact

Decay channel solenoids
Aperture and B strength

Thanks S. Gilardoni

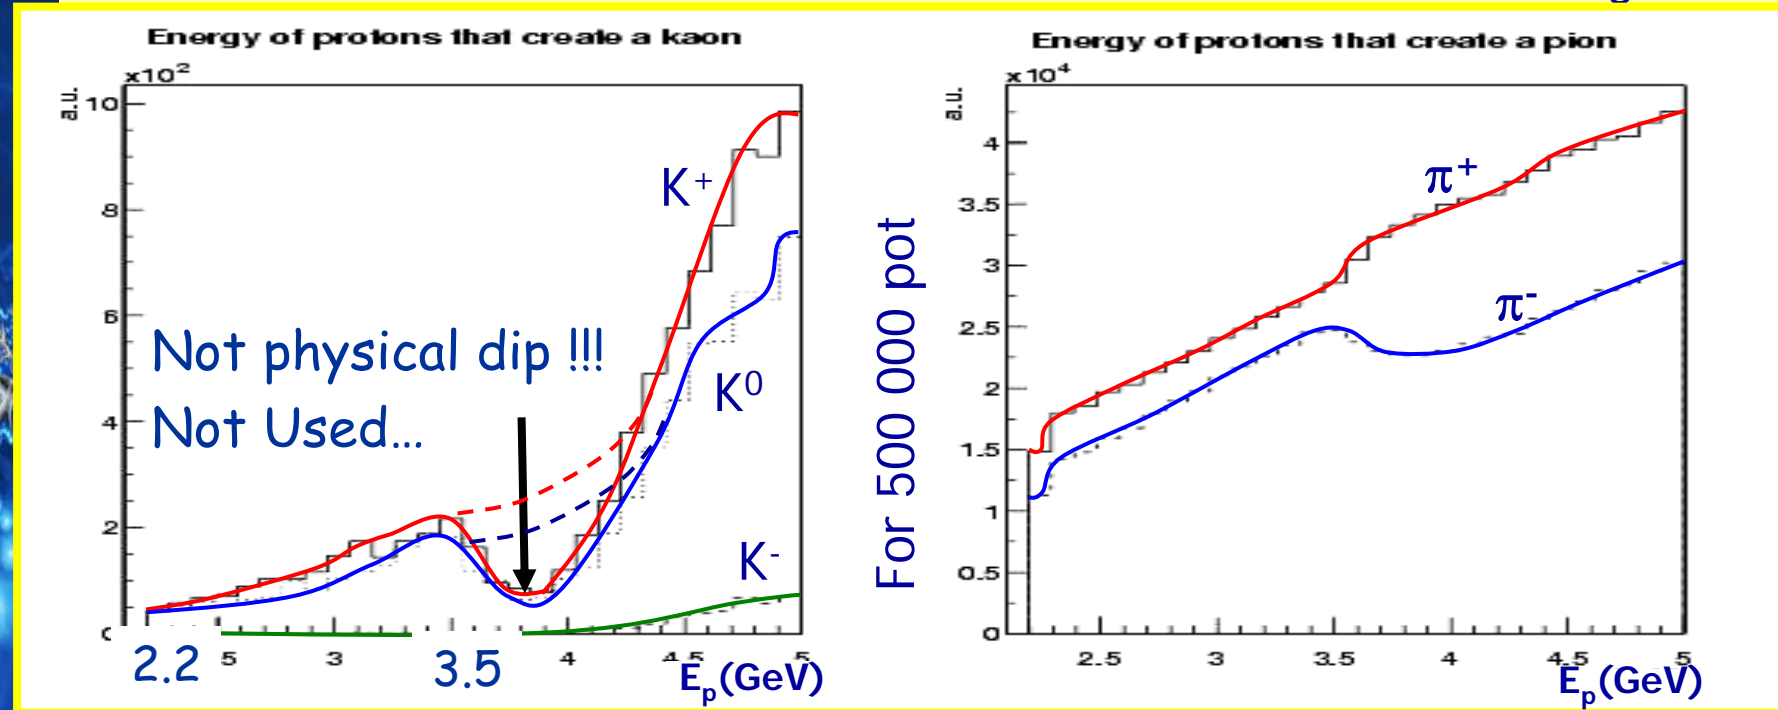

at the exit of the target

Rule of thumb: $E_\pi/3 \sim E_\nu (\text{GeV}) \gtrsim 2.L(\text{km})$

Kaon production?

see BENE meeting 11/09/03

- at 2.2GeV :
 - 0.26 π⁺/s
 - 0.8 10⁻³ K⁺/s

- at 3.5GeV :
 - 0.29 π⁺/s
 - 2.8 10⁻³ K⁺/s

- at 4.5GeV :
 - 0.32 π⁺/s
 - 5.2 10⁻³ K⁺/s

Horn design parameter

Conductor thickness : 3mm
 horn : 300kAmps
 reflector : 600kAmps
 Challenging!!!

Drawing from the horn built at CERN
 Optimized for Super Beam

Using Geant 3.2.1
 NuFact-Note 138

$$E_{\nu} \sim 300\text{MeV}$$

$$E_{\pi} \sim 800\text{MeV}$$

+ or - focusing

HORN	
inner radius	3.4cm
neck length	40cm
outer radius	20.5cm
total length	140cm
REFLECTOR	
outer radius	40cm
total length	220cm

Decay Tunnel Parameters

Length

1. modify purity
2. L=10m, 20m, 40m and 60m have been tested.
3. 10m→40m
 - $\bar{\nu}_\mu, \nu_\mu + 50\%$ to 70%
 - $\bar{\nu}_e, \nu_e + 50\%$ to 100%
4. 40m→60m
 - $\bar{\nu}_\mu, \nu_\mu + 5\%$
 - $\bar{\nu}_e, \nu_e + 20\%$

40m seems better

Radius

1. modify acceptance
2. R=1m, 1.5m and 2m have been Tested
3. 1m → 2m (L=40)
 - $\bar{\nu}_\mu, \nu_\mu + 50\%$
 - $\bar{\nu}_e, \nu_e + 50\%$ to 70%

Larger is better (2m)...

This results have been checked on sensitivity to θ_{13} and δ_{CP}

Fluxes comparison @ 130km

$\sim 95 \nu_{\mu}^{CC}/kT/yr^*$

$\langle E_{\nu} \rangle \sim 300 \text{ MeV}, 1.2 \cdot 10^{14}/100\text{m}^2/\text{yr}$

3.5 GeV SPL optimum

$\langle E_{\nu} \rangle \sim 245 \text{ MeV}, 7.5 \cdot 10^{13}/100\text{m}^2/\text{yr}$

2.2 GeV SPL optimum

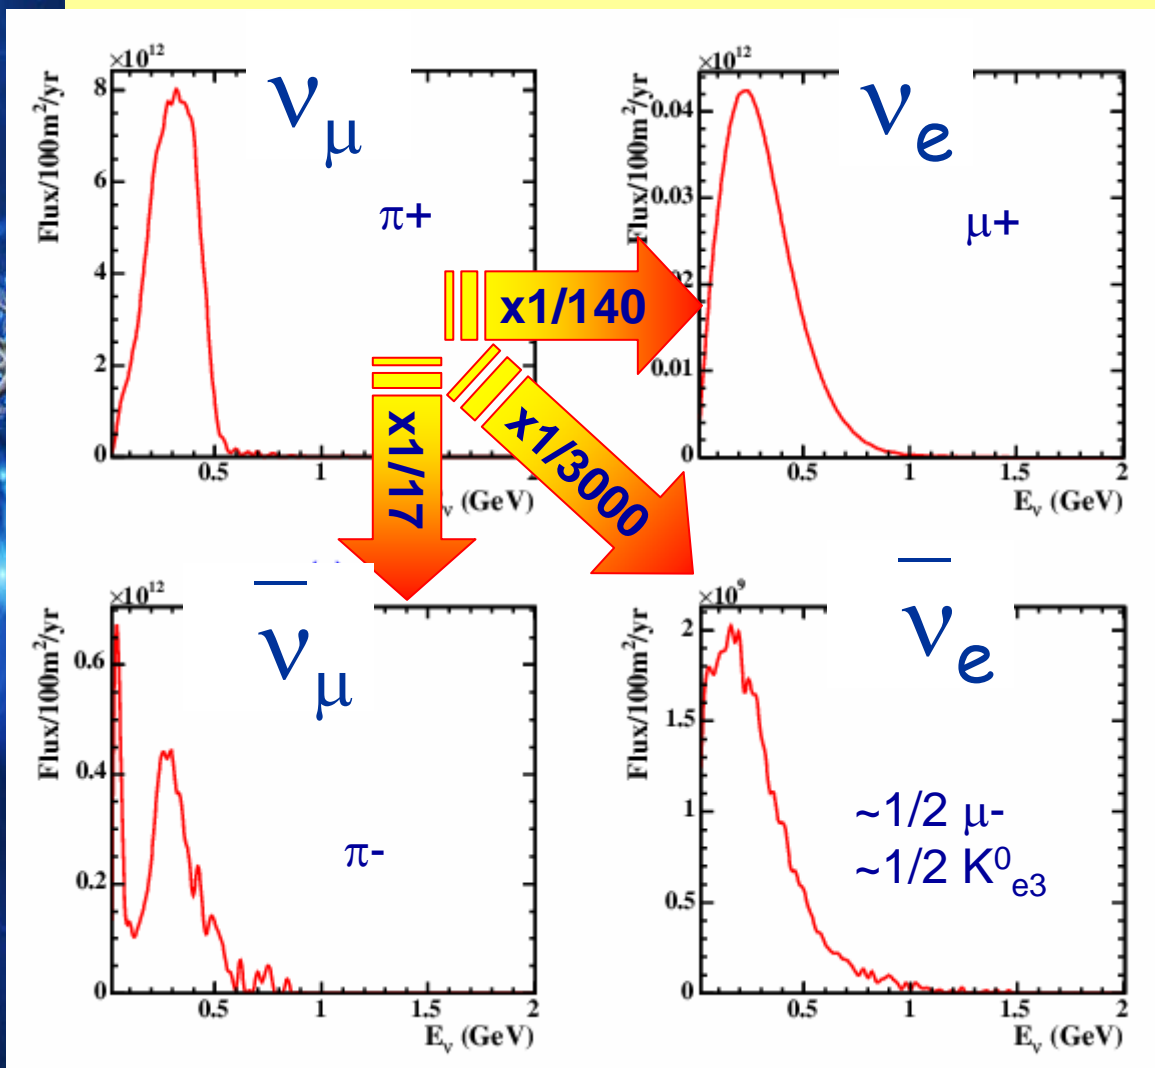

$\langle E_{\nu} \rangle \sim 275 \text{ MeV}, 4.5 \cdot 10^{13}/100\text{m}^2/\text{yr}$

Old ν Fact optimum

*: Lipari x-sect. (see later)

Flux @ 130km: + focusing

<http://opera.web.lal.in2p3.fr/horn/Simu/index.htm>

3.5 GeV Kinetic p beam
 ~800 MeV π focusing
 40m decay tunnel length
 2m decay tunnel radius

The X-sections

V.V. Lyubushkin et al., internal NOMAD memo

---: Lipari et al.
on H₂O

$\beta\beta$ is an ideal tool to measure these cross-sections and a 2% systematic error on both signal and background are used.

Analysis: GLoBES + M. Mezzetto's parameterization file

440kT x 5yrs: **2,2 Mt.yrs (+)**

	$\theta_{13} = 1^\circ$	$\theta_{13} = 3^\circ$	$\sin^2 2\theta_{13} = 0.05$

$\sin^2 2\theta_{12} = 0.82$, $\theta_{23} = \pi/4$, $\Delta m^2_{21} = 8.1 \cdot 10^{-5} eV^2$, $\Delta m^2_{31} = 2.2 \cdot 10^{-3} eV^2$

Some physics performances

440kT water Č, 4MW SPL, opti. Fluxes

5yrs (+)

True values: $(\Delta m^2_3, \sin^2 2\theta_{13})$
 $\sin^2 2\theta_{12}=0.82, \theta_{23}=\pi/4, \Delta m^2_{21}=8.1 \cdot 10^{-5} \text{ eV}^2$
 5% external precision on θ_{12} and Δm^2_{21} and
 use SPL disappearance channel and
 spectrum analysis*

2% syst. on signal & bkg

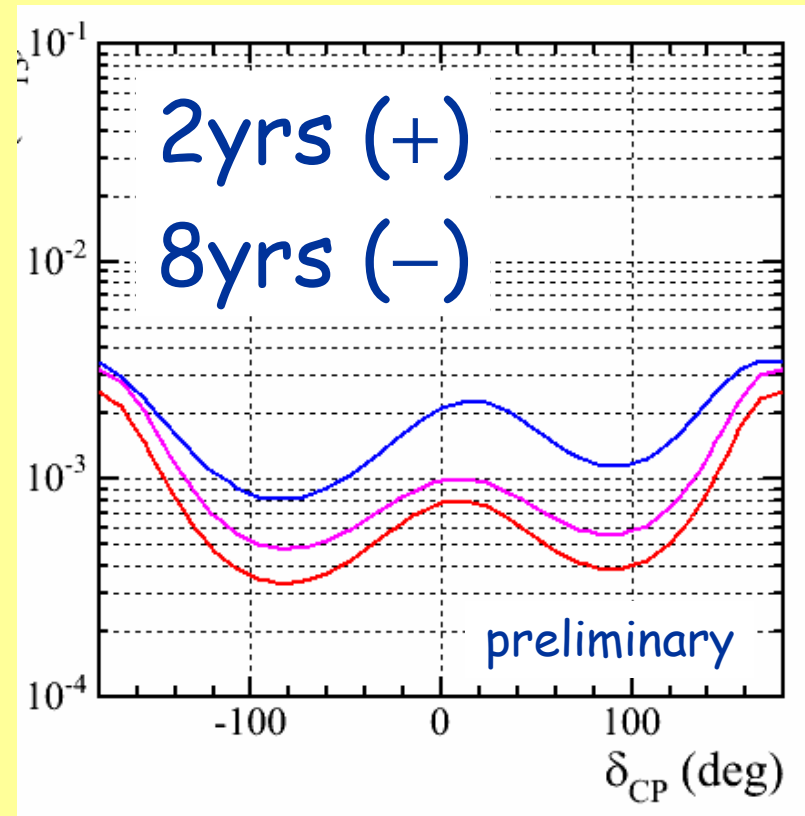

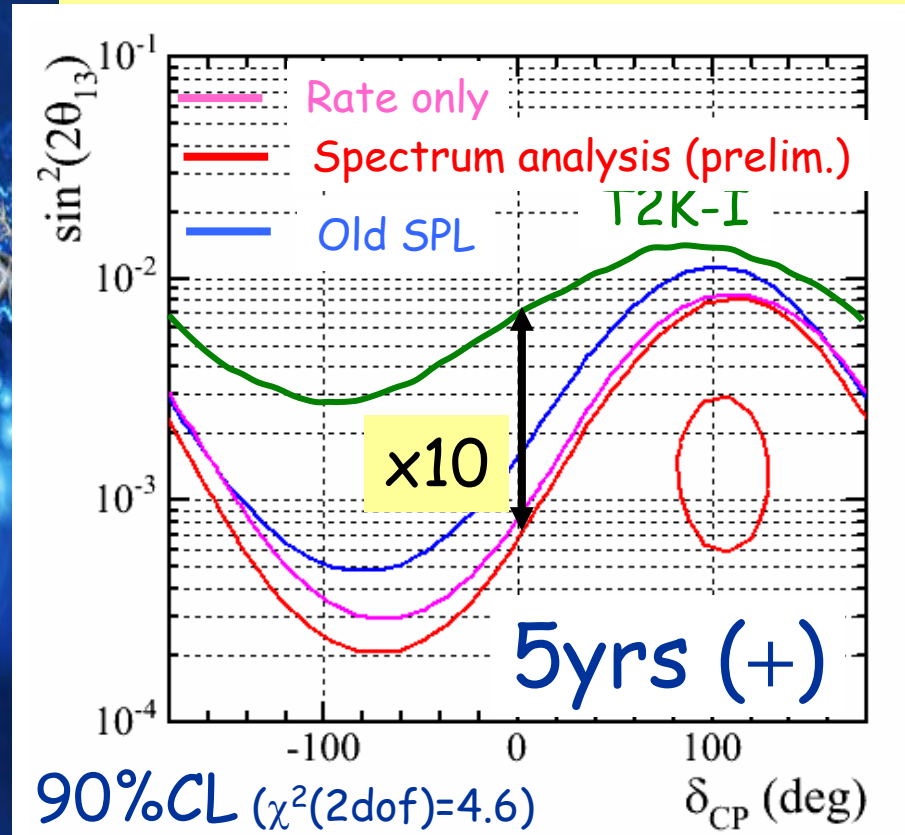

$\sin^2 2\theta_{13}(90\%CL) = 6 \cdot 10^{-3} (0.7^\circ)$

sizeable improvement

*: 5 bins [0.08,1.08] GeV

Some physics performances

True values: $\delta_{CP}=0$, $\theta_{13}=0$, $\sin^2 2\theta_{12}=0.82$, $\theta_{23}=\pi/4$, $\Delta m^2_{21}=8.1 \cdot 10^{-5}$, $\Delta m^2_{31}=2.2 \cdot 10^{-3}$
 5% external precision on θ_{12} and Δm^2_{21} and use SPL disappearance channel

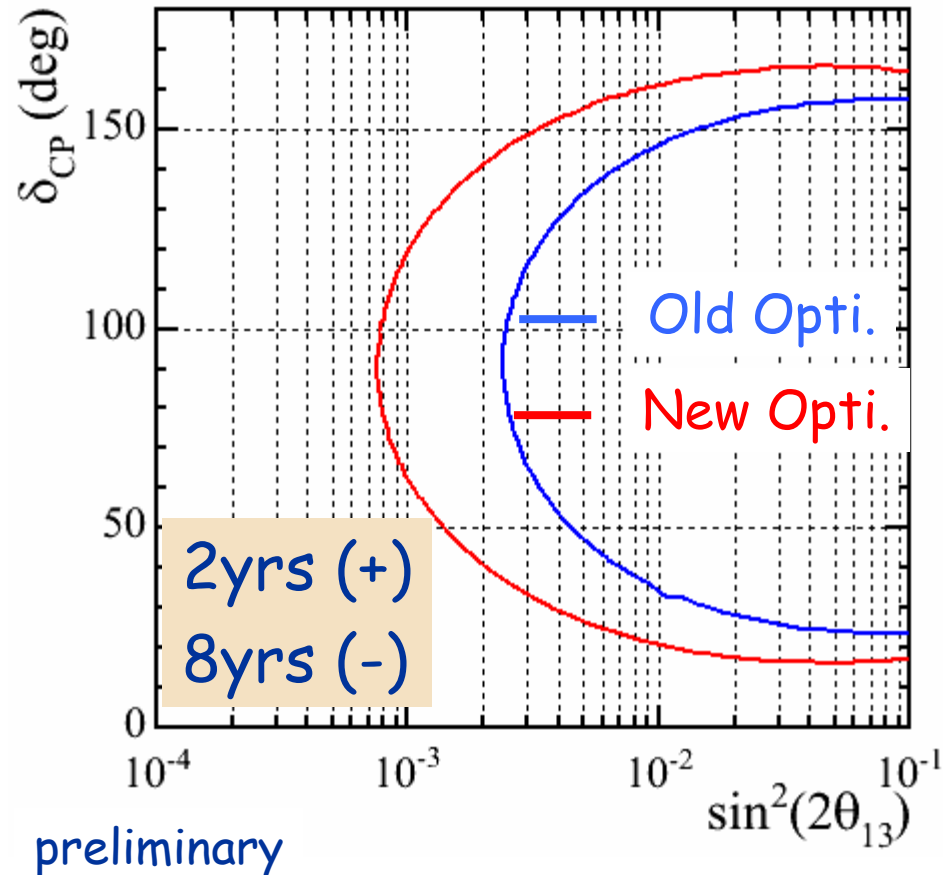

2% syst. on signal & bkg

Improve T2K-I

Some physics performances

CP discovery @ 3σ

True values (δ_{CP}, θ)

Tests $\delta_{CP}=0$ and $\delta_{CP}=\pi$

$\sin^2 2\theta_{12}=0.82, \theta_{23}=\pi/4,$

$\Delta m^2_{21}=8.1 \cdot 10^{-5}, \Delta m^2_{31}=2.2 \cdot 10^{-3}$

5% external precision on θ_{12} and Δm^2_{21}

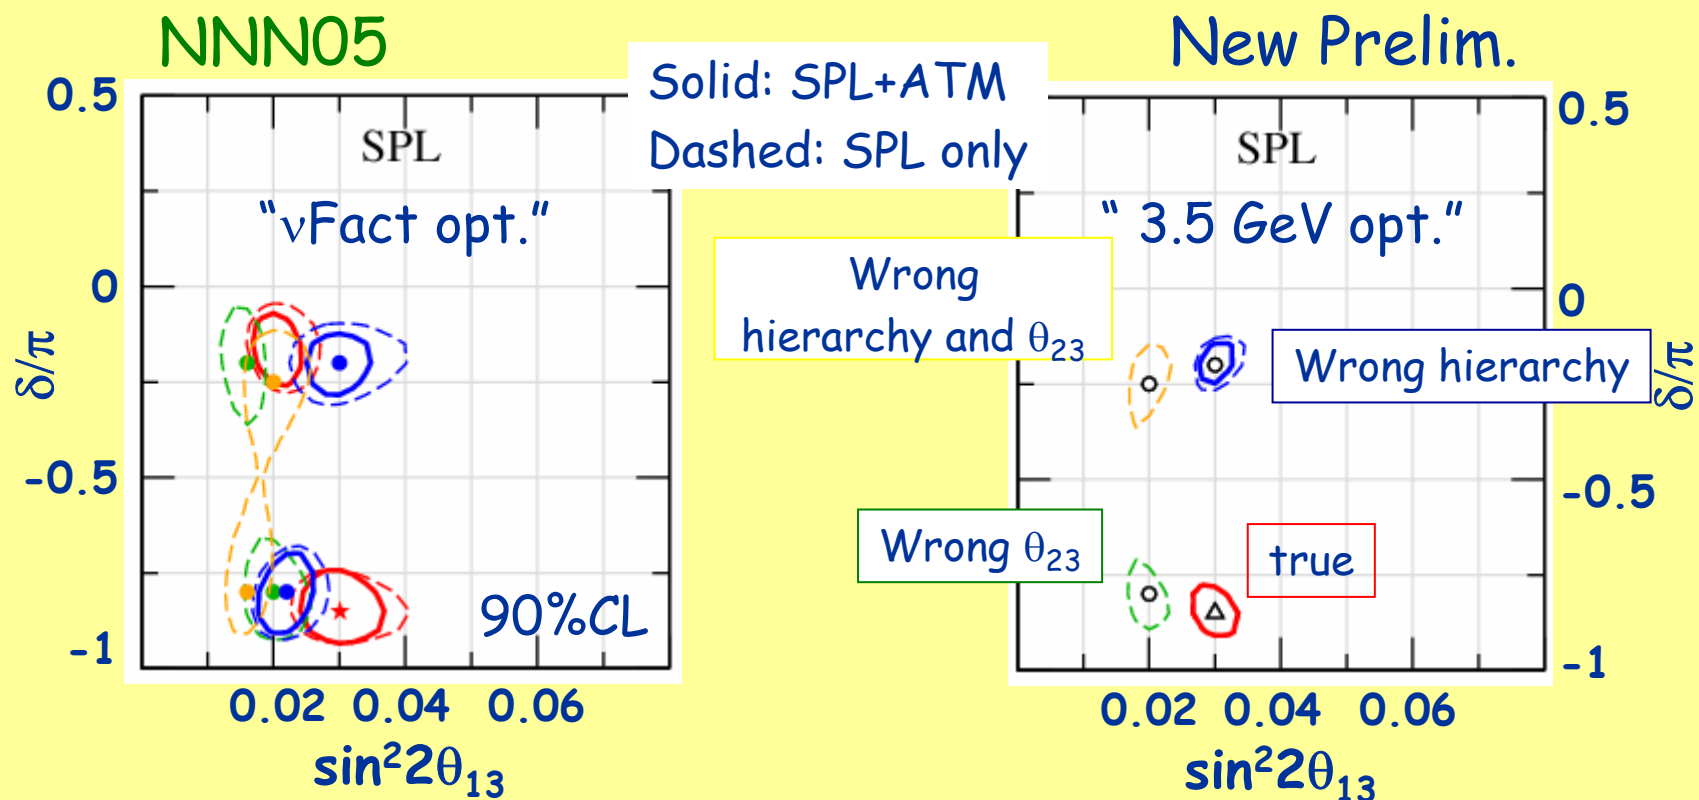

use SPL disappearance channel

2% syst on signal & bkg

Use glbChiDelta and χ^2 (1dof)=9

Evolution of the performances

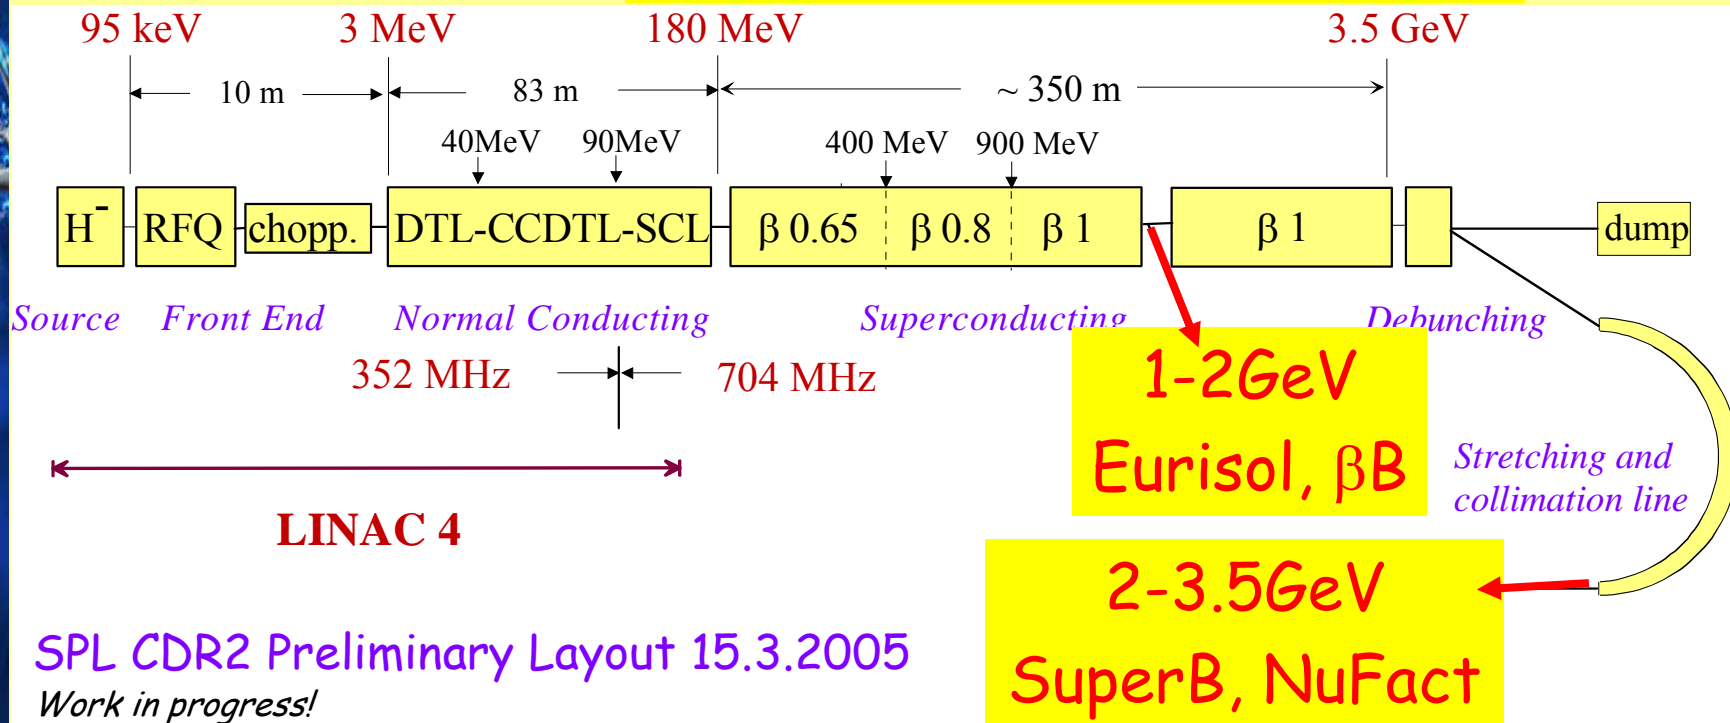

2yrs (+), 8 yrs (-)

True values: $\delta_{CP}/\pi = -0.85$, $\sin^2 2\theta_{13} = 0.03$, $\sin^2 \theta_{23} = 0.4$,
 5% external precision on $\Delta m^2_{21} = 8.1 \cdot 10^{-5}$, $\Delta m^2_{31} = 2.2 \cdot 10^{-3}$, θ_{23}

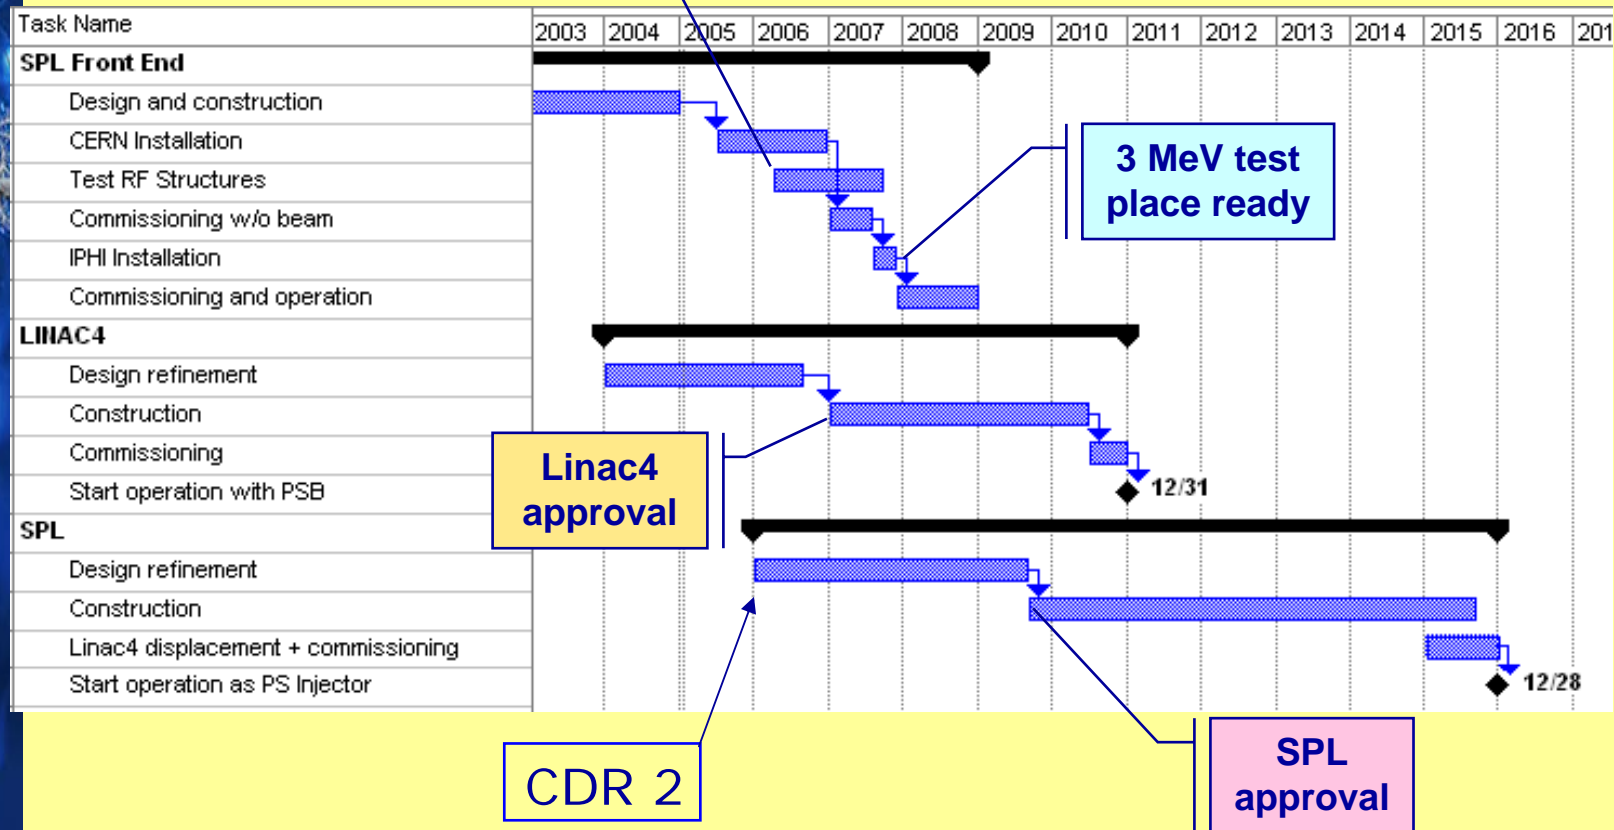

CDR2 block diagrams

CERN proton complex

Global planning (R.G courtesy)

RF tests in SM 18 of prototype structures* for Linac4

Summary

Higher proton energy & SB Horn specific

1. new baseline: $3.5\text{GeV}/2\text{m}/40\text{m}$

θ_{13} sensitivity:

- ✓ sensitivity to $\theta_{13} = 0.7^\circ$ (5yrs +): gain +25% wrt old result
- ✓ down to $\theta_{13} = 1.4^\circ$ with the 10yrs mixed scenario independently of δ_{CP}
- ✓ Improve T2K-I by a factor 10 at $\delta_{CP} = 0$ (5yrs +)

Can discover CP violation

Can solve ambiguities alone and result is improved thanks to $ATM\nu$ (Th. Schwetz 's talk)

Complementary to BetaBeam to cross check the background and improve δ_{CP} sensitivity (M. Mezzetto's talk)

Thank you
