

**Design of a pan-European
infrastructure for
Large Apparatus for Grand
Unification and Neutrino
Astrophysics
(LAGUNA)**

André Rubbia (ETHZ)

*ApPEC/ASPERA thematic group low on energy neutrino
and proton decay, Chambery, March 2nd*

A new infrastructure in Europe ?

2

A new infrastructure in Europe ?

2

- Advances in low energy neutrino astronomy and direct investigation of Grand Unification require the construction of very large volume underground observatories.

A new infrastructure in Europe ?

2

- Advances in low energy neutrino astronomy and direct investigation of Grand Unification require the construction of very large volume underground observatories.
- There is currently no such infrastructure in Europe able to host underground instruments of this size, although many national underground laboratories with high technical expertise are currently operated with leading-edge smaller-scale underground experiments.

- There is currently no such infrastructure in Europe able to host underground instruments of this size, although many national underground laboratories with high technical expertise are currently operated with leading-edge smaller-scale underground experiments.
- A pan-European infrastructure able to host underground instruments with volumes up to 1'000'000 m³ will provide new and unique scientific opportunities in low energy neutrino astronomy and Grand Unification physics.
- This field of research is at the forefront of particle and astro-particle physics and is the subject of intense investigation also in North America and Asia. Such an infrastructure in Europe would attract scientists from all over the world and ensure that Europe will continue to play a leading and innovative role in the field.

Grand Unification and Neutrino Astrophysics

3

3

Grand Unification and Neutrino Astrophysics

3

- **Rare event detection in very massive detectors will allow the search for proton decays with an unprecedented sensitivity. Proton decay is the most generic and directly verifiable consequence of Grand Unification (GU)**
 - Detecting proton decay implies de facto discovering GU
 - GU implies a new fundamental symmetry between quarks & leptons (hence explains their identical number)
 - GU explains electric charges of elementary fermions
 - GU guides models of fermion masses and mixing
 - GU is one of the motivation for SUSY and SUSY predicts LSP as dark matter
 - GU motivates see-saw (N_R) and consequently tiny neutrino masses

Grand Unification and Neutrino Astrophysics

 - Detecting proton decay implies de facto discovering GU
 - GU implies a new fundamental symmetry between quarks & leptons (hence explains their identical number)
 - GU explains electric charges of elementary fermions
 - GU guides models of fermion masses and mixing
 - GU is one of the motivation for SUSY and SUSY predicts LSP as dark matter
 - GU motivates see-saw (N_R) and consequently tiny neutrino masses
- **Very massive underground detectors will provide an extensive next generation neutrino physics programme**
 - They will detect neutrinos from a galactic Supernova, greatly advancing our understanding of stellar explosions and neutrino properties.
 - They could also further study the Sun's interior with real-time solar neutrino detection and detect geo-neutrinos, as well study of neutrinos produced in the Earth's upper atmosphere with high statistics.
 - Coupled to artificial neutrino beams, they will measure neutrino flavour oscillations with an unprecedented precision and offer new opportunities like the discovery of CP-violation in the leptonic sector.

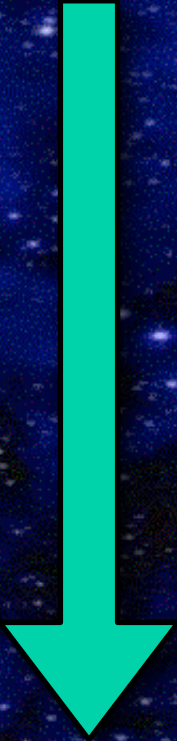

Physics focus

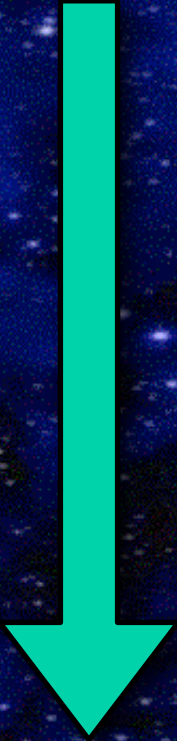

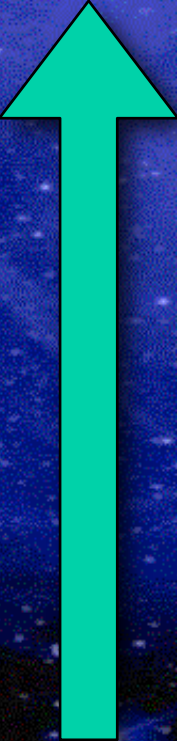

4

4

- Direct evidence for Grand Unification (Proton decay)
- Low energy neutrino astronomy
- Long baseline neutrino beam

- 
- Direct evidence for Grand Unification (Proton decay)
 - Low energy neutrino astronomy
 - Long baseline neutrino beam

 - Long baseline neutrino beam

A very rich field !

5

5

A very rich field !

5

- Historically a very rich field (SN1987A, solar & atmospheric neutrinos). The physics programme addressed by LAGUNA will span the next 30 years.

A very rich field !

5

- Historically a very rich field (SN1987A, solar & atmospheric neutrinos). The physics programme addressed by LAGUNA will span the next 30 years.
- Testing proton lifetime up to 10^{35} years will provide a very stringent, perhaps ultimate, test of the Grand Unification hypothesis

A very rich field !

5

- Historically a very rich field (SN1987A, solar & atmospheric neutrinos). The physics programme addressed by LAGUNA will span the next 30 years.
- Testing proton lifetime up to 10^{35} years will provide a very stringent, perhaps ultimate, test of the Grand Unification hypothesis
- After the optical observation of supernovae by mankind during the last centuries and the SN1987A neutrino detection, the next observable event with neutrinos will occur with high probability in the next decade and with certainty in the next 30 years. Neutrinos will shed more light on the SN explosion mechanisms than optical light!

A very rich field !

- Historically a very rich field (SN1987A, solar & atmospheric neutrinos). The physics programme addressed by LAGUNA will span the next 30 years.
- Testing proton lifetime up to 10^{35} years will provide a very stringent, perhaps ultimate, test of the Grand Unification hypothesis
- After the optical observation of supernovae by mankind during the last centuries and the SN1987A neutrino detection, the next observable event with neutrinos will occur with high probability in the next decade and with certainty in the next 30 years. Neutrinos will shed more light on the SN explosion mechanisms than optical light!
- The study of neutrinos properties have shown the first indication of physics beyond the Standard Model of Elementary Particles. New discoveries, like CP-violation in the leptonic sector, are expected in this field.

A very rich field !

- Historically a very rich field (SN1987A, solar & atmospheric neutrinos). The physics programme addressed by LAGUNA will span the next 30 years.
 - Testing proton lifetime up to 10^{35} years will provide a very stringent, perhaps ultimate, test of the Grand Unification hypothesis
 - After the optical observation of supernovae by mankind during the last centuries and the SN1987A neutrino detection, the next observable event with neutrinos will occur with high probability in the next decade and with certainty in the next 30 years. Neutrinos will shed more light on the SN explosion mechanisms than optical light!
 - The study of neutrinos properties have shown the first indication of physics beyond the Standard Model of Elementary Particles. New discoveries, like CP-violation in the leptonic sector, are expected in this field.
- High-energy accelerators like the LHC or the planned ILC cannot directly answer these fundamental questions about Nature. This was also recognized in the CERN European roadmap for particle physics: *“A range of very important non-accelerator experiments take place at the overlap between particle and astroparticle physics exploring otherwise inaccessible phenomena; Council will seek to work with ApPEC to develop a coordinated strategy in these areas of mutual interest.”*

Sensitivity to proton decay: comparison with theory

Higher dimension models (eg. 6D SO(10)) not included
Definitively not exhaustive.

Supernova type-II neutrinos

⇒ Access supernova and neutrino physics simultaneously

⇒ Decouple supernova & neutrino properties via different detection channels

1. Supernova physics:

- Gravitational collapse mechanism
- Supernova evolution in time
- Burst detection
- Cooling of the proto-neutron star
- Shock wave propagation
- Black hole formation?

2. Neutrino properties

- Neutrino mass (time of flight delay)
- Oscillation parameters (flavor transformation in SN core and/or in Earth): Type of mass hierarchy and θ_{13} mixing angle

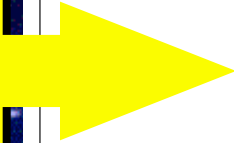

3. Early alert for astronomers

- Pointing to the supernova

ApPEC Roadmap, January 2007

Proton
decay and
low energy
neutrino
astrophysics

Field/ Experiments	Cost scale (M€)	Desirable start of construction	Remarks
Dark Matter Search: Low background experiments with 1-ton mass	60-100 M€	2011-2013	2 experiments (different nuclei, different techniques), e.g. 1 bolometric, 1 noble liquid; more than 2 worldwide.
Proton decay and low energy neutrino astronomy: Large infrastructure for p- decay and ν astronomy on the 100kt-1Mton scale	400-800 M€	2011-2013	- multi-purpose - 3 different techniques; large synergy between them. - needs huge new excavation - expenditures likely also after 2015 - worldwide sharing - possibly also accelerator neutrinos in long baseline experiments
The high energy universe: <u>Gamma rays:</u> Cherenkov Telescope Array CTA	100 M€ (South) 50 M€ (North)	first site in 2010	Physics potential well defined by rich physics from present gamma experiments
<u>Charged Cosmic Rays:</u> Auger North	85 M€	2009	Confirmation of physics potential from Auger South results expected in 2007
<u>Neutrinos:</u> KM3NeT	300 M€	2011	FP6 design study. Confirmation of physics potential from IceCube and gamma ray telescopes expected in 2008-2010
Gravitational Waves: Third generation interferometer	250-300 M€	Civil engineering 2012	Conceived as underground laboratory

LAGUNA WG is a coordinated European effort

9

- **A working group aimed towards common physics goals**
 - Proposed and accepted at the ApPEC “Munich meeting” on November 2005

LAGUNA WG is a coordinated European effort

9

- **A working group aimed towards common physics goals**
 - Proposed and accepted at the ApPEC “Munich meeting” on November 2005
- **Develop conceptual designs for European large underground detectors**
 - Investigate physics complementarities and common R&D needs.
 - Provide a coherent and well-coordinated EU wide efforts. Work in synergy.
 - Solve common problems together.
 - Take into account the unique technological expertise in Europe and other existing or planned programs in the world.

9

LAGUNA WG is a coordinated European effort

9

- **A working group aimed towards common physics goals**
 - Proposed and accepted at the ApPEC “Munich meeting” on November 2005
- **Develop conceptual designs for European large underground detectors**
 - Investigate physics complementarities and common R&D needs.
 - Provide a coherent and well-coordinated EU wide efforts. Work in synergy.
 - Solve common problems together.
 - Take into account the unique technological expertise in Europe and other existing or planned programs in the world.
- **Mature designs and credible proposals should emerge around 2010.**
- This effort, although oriented towards a potential infrastructure in Europe, also allows Europeans to contribute in a coherent way and possibly with better impact, to the on-going discussions worldwide.

9

The step to very large volume liquid detectors

- **Three complementary techniques are currently being investigated for next generation large volume underground rare event observatories**
 1. Water Cerenkov imaging
 - Ongoing R&D effort on photodetection in Europe: MEMPHYS
 - Synergy with HK (Japan) and UNO (USA)
 2. Liquid scintillator
 - Ongoing R&D on scintillator characterization in Europe: LENA
 - Connected to BOREXINO R&D programme and DOUBLE-CHOOZ
 3. Liquid argon time-projection chamber
 - Technology pioneered in Europe by the ICARUS R&D programme
 - Two new independent and on-going R&D efforts: GLACIER in Europe and LARTPC in USA

The step to very large volume liquid detectors

- **Three complementary techniques are currently being investigated for next generation large volume underground rare event observatories**
 1. Water Cerenkov imaging
 - Ongoing R&D effort on photodetection in Europe: MEMPHYS
 - Synergy with HK (Japan) and UNO (USA)
 2. Liquid scintillator
 - Ongoing R&D on scintillator characterization in Europe: LENA
 - Connected to BOREXINO R&D programme and DOUBLE-CHOOZ
 3. Liquid argon time-projection chamber
 - Technology pioneered in Europe by the ICARUS R&D programme
 - Two new independent and on-going R&D efforts: GLACIER in Europe and LARTPC in USA
- **The construction of very large detectors of those technologies appears possible, but requires detailed design studies to optimize the underground implementation in very large scale and the most promising technologies under well controlled cost estimates.**
- **In parallel, design studies for site(s) to build the required infrastructure for these very large detectors under controlled cost boundaries, are mandatory.**

Large Underground detectors considered in LAGUNA

11

11

Large Underground detectors considered in LAGUNA

MEMPHYS

Water Cherenkov ($\approx 0.5 \rightarrow 1$ Mton)

LENA

Liquid Scintillator ($\rightarrow 50$ kton)

GLACIER

Liquid Argon ($\approx 10 \rightarrow 100$ kton)

LAGUNA WG constituency

12

- **≈60 members**
- **22 institutes** from CH, DE, ESP, FR, FIN, I, POL, UK
- **University of Bern, CPPM, CUPP, University of Helsinki, University of Katowice, University of Krakow, IN2P3/CNRS-LAL, IN2P3/CNRS-LPNHE, University of Granada, University of Hamburg, Max-Planck-Institut für Kernphysik Heidelberg, University of Jyväskylä, Max-Planck-Institut für Physik München, Technische Universität München, University of Oulu, Institut de Physique Nucléaire Orsay, INFN/University of Padova, APC-Paris, DAPNIA/CEA-Saclay, University of Sheffield, ETH-Zürich**
- **New interest was raised at Valencia meeting**
- **List of “participants” (contractors in FP6) for LAGUNA DS in the process of being defined. Includes:**
 - All underground laboratories (CUPP, LNGS, LSC, LSM, IUS, SUNLAB)
 - All involved scientific partners
 - Some industrial partners

- During the last months, an effort has been made to consolidate these ideas into a format compatible with a potential “design study”.
- A series of working meeting were held
 - ✓ Munich, April 24th, 2006
 - ✓ Munich, June 2nd, 2006
 - ✓ Paris, July 21st, 2006
 - ✓ Zurich, October 12th, 2006
 - ✓ Paris, December 18th, 2006
 - Next: Chambery, March 2nd, 2007
- A scientific case document (~30 pages) has been drafted.
- A list of Working Packages, in a suitable form for the FP7 DS, has been prepared.
- The list of milestones & deliverables with detailed tables of tasks has still to be elaborated.
- The potential FP7 DS document is being drafted (preliminary version) to be finalized until May 2007.

In two sentences...

In two sentences...

- The DS will provide the scientific and objective information to make an optimized choice for site(s) for an European Underground Infrastructure capable of very large volume underground instruments.

In two sentences...

- The DS will provide the scientific and objective information to make an optimized choice for site(s) for an European Underground Infrastructure capable of very large volume underground instruments.
- The deliverables contain the elaboration of “decision factors” like
 - (i) technical feasibility (cavern, access, safety, liquid procurement, ...)
 - (ii) cost optimization of infrastructure (digging, safety, ...)
 - (iii) physics performance (e.g. depth, baseline, ...)
 - (iv) ...

Proposal full title	A Design Study for Large Apparati for Grand Unification and Neutrino Astrophysics
Proposal acronym	LAGUNA

DRAFT

**EU contribution, Timescale:
5 M€ over 3-4 years (estimate)**

Table of contents

1. Introduction.....	3
2. Scientific goals and European added value of the new Infrastructure.....	4
3. Scientific and Technological excellence	6
3.1. Working packages and implementation plan.....	6
3.1.1. WP 1: Underground infrastructures (site engineering).....	6
3.1.2. WP 2: Underground Tanks.....	8
3.1.3. WP 3: Tank Instrumentation	9
3.1.4. WP 4: Liquid procurement and handling systems.....	9
3.1.5. WP 5: Safety & Environment.....	10
3.1.6. WP 6: Underground science.....	11
3.1.7. WP 7: Management and coordination	11
4. Relevance to the Objectives of the scheme	11
4.1. Justification of the proposed Design Study	11
4.2. Exploring the feasibility of the infrastructure	12
5. Quality of the Management	12
5.1. Management and Competence of the Participants	12
5.2. Justification of the Financing Requested.....	12

TOTAL		5.0+5.1 M€

Where?

IUS

Institute of Underground Science in Boulby mine, UK

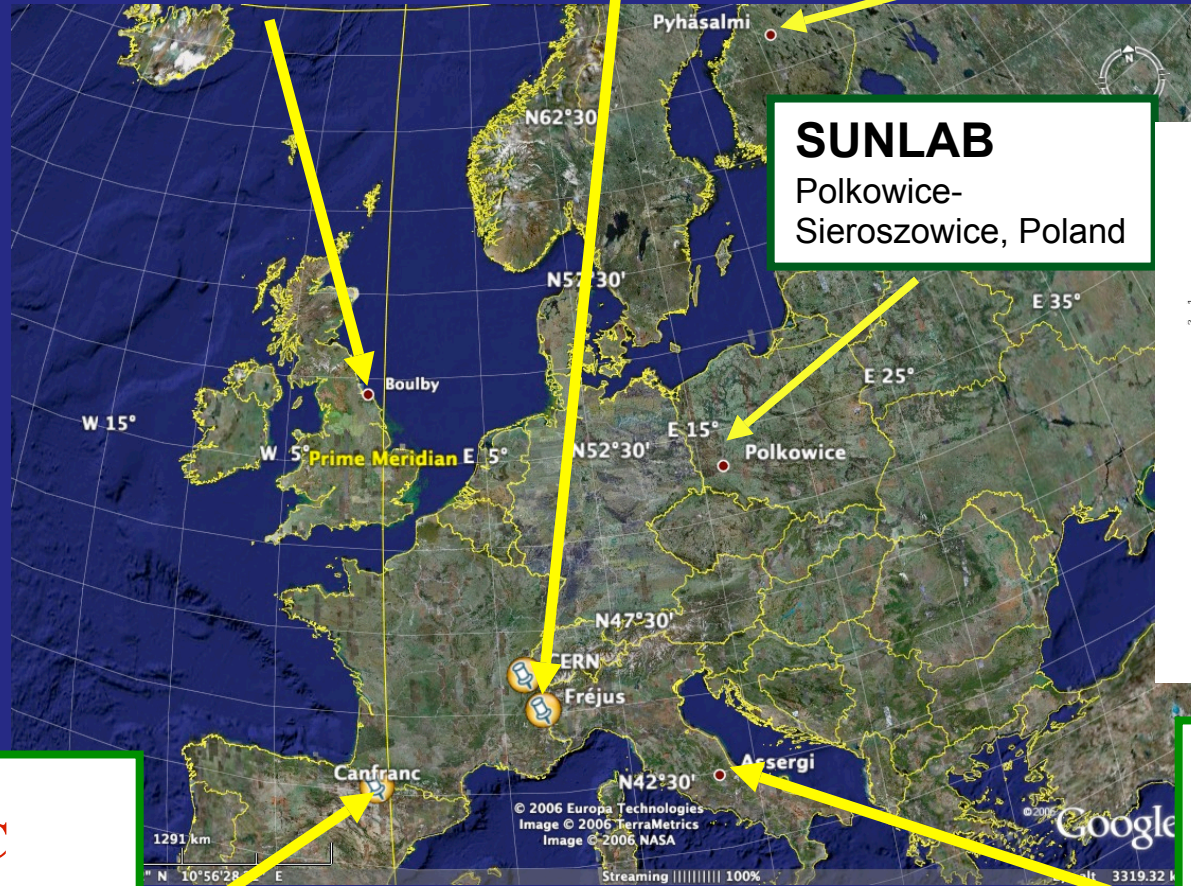

Laboratoire Souterrain de Modane, France

CENTRE FOR UNDERGROUND PHYSICS IN PYHÄSALMI MINE

Currently there is no available sight to host very large scale detectors in Europe!

- New facilities will have to be excavated or old one extended
- What depth?
- What other synergies? (beamline distance)
- What is the distance from reactors?

SUNLAB
Polkowice-Sieroszowice, Poland

LSC

Laboratorio Subteraneo de Canfranc, Spain

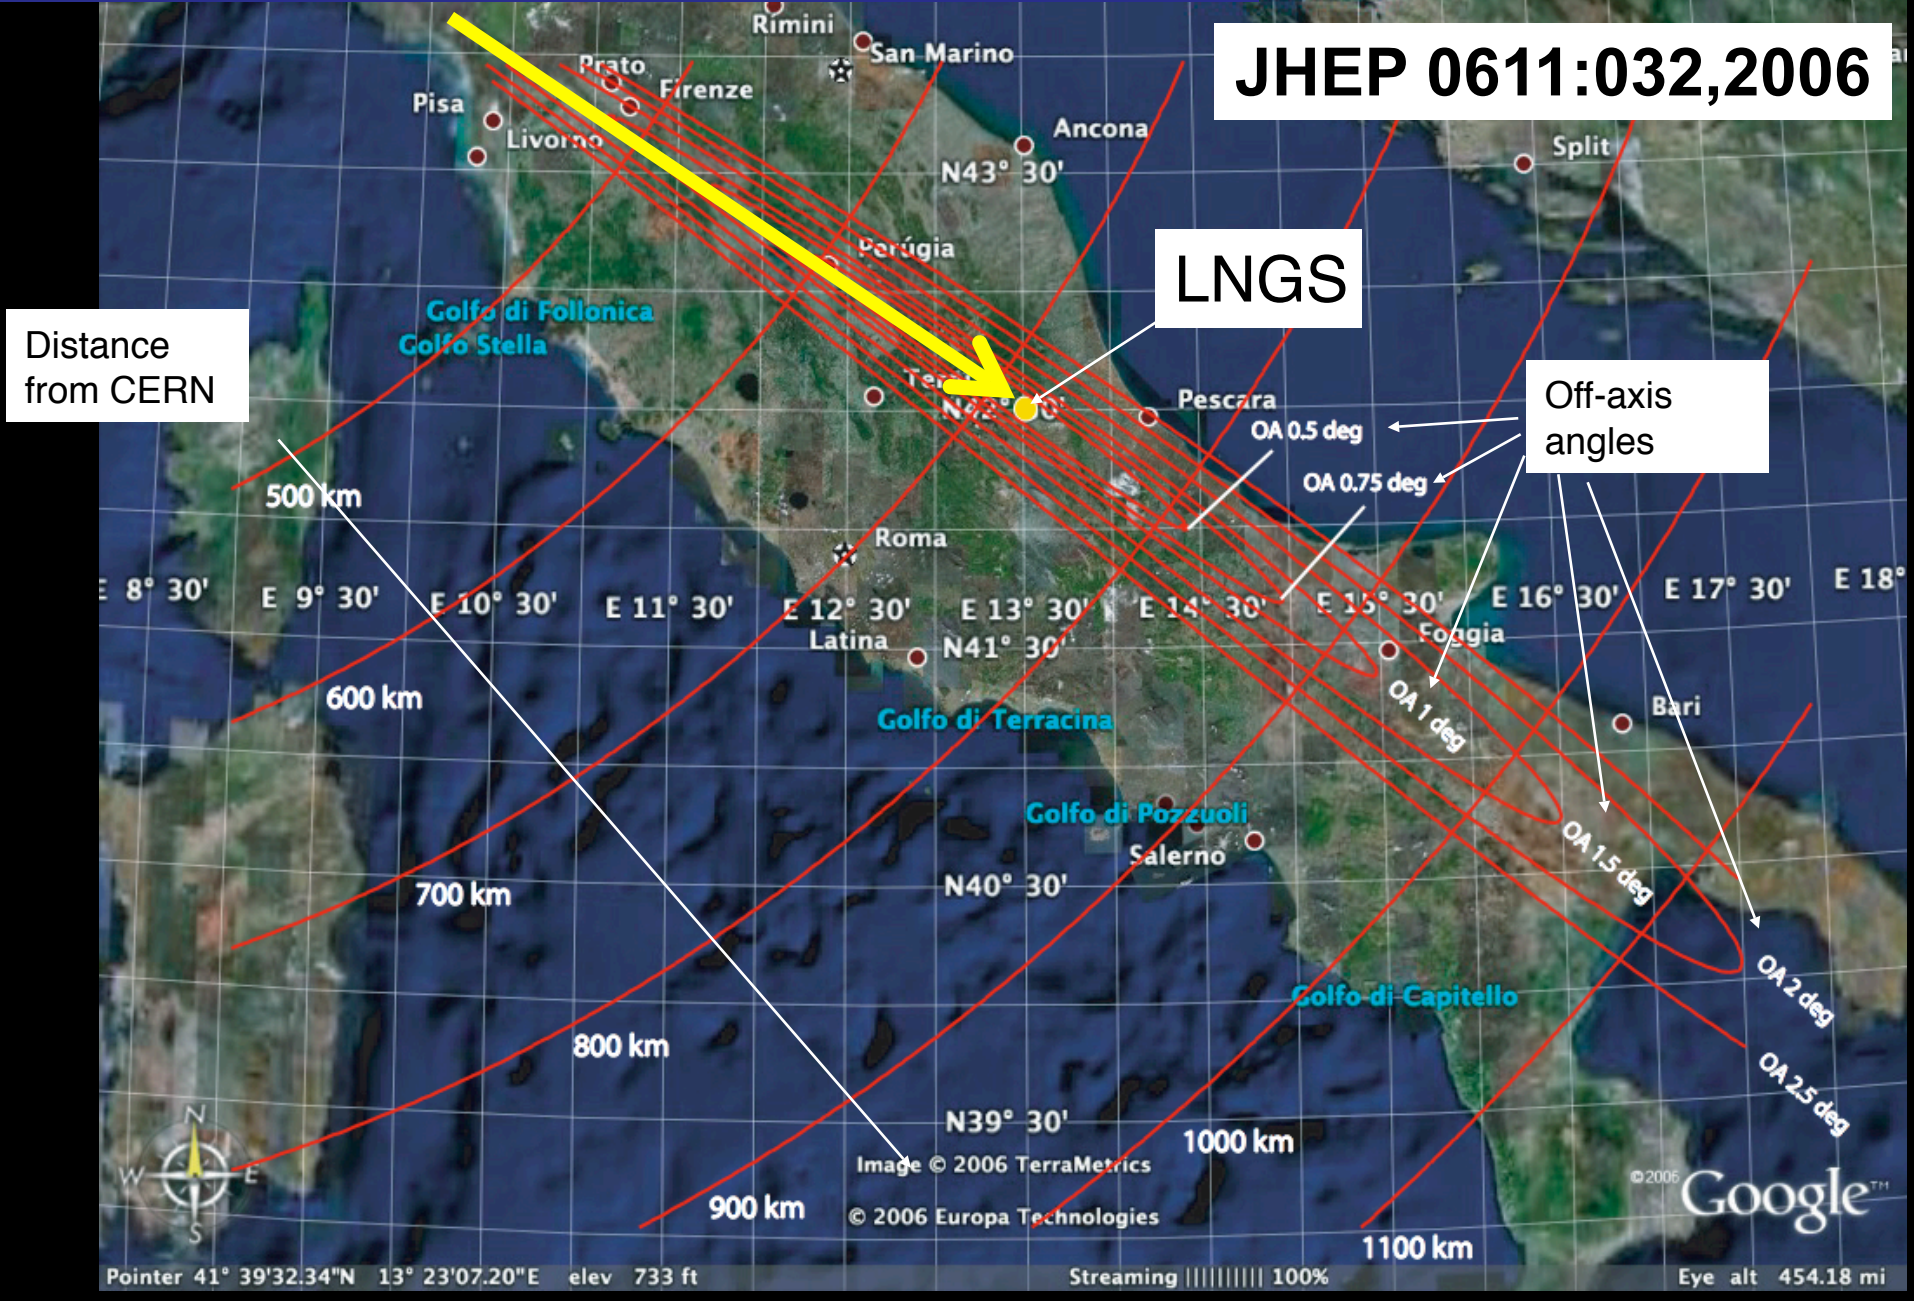

LNGS

Laboratori Nazionali del Gran Sasso, Italy

Example: baselines from CERN

The current European LBL beam (CNGS)

Outlook

21

Outlook

21

- Advances in low energy neutrino astronomy and direct investigation of Grand Unification require the construction of very large volume underground observatories.

Outlook

21

- Advances in low energy neutrino astronomy and direct investigation of Grand Unification require the construction of very large volume underground observatories.
- The direct evidence for Grand Unification would be one of the most fundamental discoveries in particle physics. This requires new generation very massive detectors.

- Advances in low energy neutrino astronomy and direct investigation of Grand Unification require the construction of very large volume underground observatories.
- The direct evidence for Grand Unification would be one of the most fundamental discoveries in particle physics. This requires new generation very massive detectors.
- An extensive neutrino physics and astronomy programme will be accessible with these new rare event detection instruments, detecting supernova, atmospheric, possibly solar and geo-neutrinos, as well as artificial neutrinos from accelerators. These latter measurements could lead to the discovery of CP-violation in the leptonic sector.

- Advances in low energy neutrino astronomy and direct investigation of Grand Unification require the construction of very large volume underground observatories.

The DS will provide the means to elaborate the scientific and objective information needed to make an optimized choice for site(s) for the pan-European Underground Infrastructure.
- It should mature around 2010 and lead to possible construction decision soon after, when a few years of running of LHC and T2K&NovA&DOUBLE CHOOZ will have drawn the new landscape concerning supersymmetry, unification, and hopefully the last unknown neutrino mixing angle θ_{13} .
